the verilog hardware description language verilog hdl has long been the most popular language for describing complex digital hardware it started life as a proprietary language but was donated by cadence design systems to the design community to serve as the basis of an open standard that standard was formalized in 1995 by the ieee in standard 1364 1995 about that same time a group named analog verilog international formed with the intent of proposing extensions to verilog to support analog and mixed signal simulation the first fruits of the labor of that group became available in 1996 when the language definition of verilog a was released verilog a was not intended to work directly with verilog hdl rather it was a language with similar syntax and related semantics that was intended to model analog systems and be compatible with spice class circuit simulation engines the first implementation of verilog a soon followed a version from cadence that ran on their spectre circuit simulator as more implementations of verilog a became available the group defining the a log and mixed signal extensions to verilog continued their work releasing the definition of verilog ams in 2000 verilog ams combines both verilog hdl and verilog a and adds additional mixed signal constructs providing a hardware description language suitable for analog digital and mixed signal systems again cadence was first to release an implementation of this new language in a product named ams designer that combines their verilog and spectre simulation engines

overview and goals wireless communication technologies are undergoing rapid advancements the last few years have experienced a steep growth in research in the area of wireless sensor networks wsns in wsns communication takes place with the help of spatially distributed autonomous sensor nodes equipped to sense specific information wsns especially the ones that have gained much popularity in the recent years are typically ad hoc in nature and they inherit many characteristics features of wireless ad hoc networks such as the ability for infrastructure less setup minimal or no reliance on network planning and the ability of the nodes to self organize and self configure without the involvement of a centralized network manager router access point or a switch these features help to set up wsns fast in situations where there is no existing network setup or in times when setting up a fixed infrastructure network is considered infeasible for example in times of emergency or during relief operations wsns find a variety of applications in both the military and the civilian population worldwide such as in cases of enemy intrusion in the battlefield object tracking habitat monitoring patient monitoring re detection and so on even though sensor networks have emerged to be attractive and they hold great promises for our future there are several challenges that need to be addressed some of the well known challenges are attributed to issues relating to coverage and deployment scalability quality of service size computational power energy efficiency and security
