behe argues that the complexity of cellular biochemistry argues against darwin s gradual evolution

between 1940 and 1970 pioneers in the new field of cell biology discovered the operative parts of cells and their contributions to cell life they offered mechanistic accounts that explained cellular phenomena by identifying the relevant parts of cells the biochemical operations they performed and the way in which these parts and operations were organised to accomplish important functions cell biology was a revolutionary science but in this book it also provides fuel for yet another revolution one that focuses on the very conception of science itself laws have traditionally been regarded as the primary vehicle of explanation but in the emerging philosophy of science it is mechanisms that do the explanatory work bechtel emphasises how mechanisms were discovered focusing especially on the way in which new instruments made these inquiries possible he also describes how new journals and societies provided institutional structure to this new enterprise

the fascinating machinery that life uses to harness energy is the focus of this volume of the advances in photosynthesis and respiration series experts in the field communicate their insights into the mechanisms that govern biological energy conversion from the atomic scale to the physiological integration within organisms by leveraging the power of current structural techniques the authors reveal the inner workings of life

current topics in bioenergetics volume 4 provides information pertinent to the molecular basis for energy transduction in membranous systems this book presents the developments of relevant techniques in the field of bioenergetics organized into eight chapters this volume begins with an overview of nonequilibrium and fluorescent probes that deal with relatively unexplored areas this text then discusses the problem of pathways and mechanisms of energy transformations in the cell other chapters consider the transport of ions across the plasma membrane of nearly all living cells which is a necessary condition for the maintenance of the vital life processes this book discusses as well that bacterial synthesis offers basic and valuable information of general significance and remarkably stimulating challenges with direct bearing on different aspects of the problem of the basic mechanisms involved in biological electron transport coupled energy conversion the final chapter deals with the general models for the transport of sodium and potassium this book is a valuable resource for biologists and biochemists
