one of the fundamental challenges currently facing the eu is that of reconciling its economic and environmental policies nevertheless the role of environmental protection in eu competition law and policy has often been overlooked recent years have witnessed a shift in environmental regulation from reliance on command and control to an increased use of market based environmental policy instruments such as environmental taxes green subsidies emissions trading and the encouragement of voluntary corporate green initiatives by bringing the market into environmental policy such instruments raise a host of issues that

competition law must address this interdisciplinary treatment of the interaction between these key eu policy areas challenges the view that eu competition policy is a special case insulated from environmental concerns by the overriding efficiency imperative and puts forward practical proposals for achieving genuine integration

during the last decades environmental economics as a science has been very successful in improving our understanding of environment economy interdependence using conventional economic methodology environmental aspects have been explicitly incorporated into economic models making use of the concept of

externality this concept was already familiar to economists long before evidence of severe environmental deterioration found its way into the headlines and people's awareness but before that time external effects were not considered as being empirically very relevant they seemed to be like the example of the bees and the fruit trees somewhat bucolic in nature all that changed dramatically when it was no longer possible or easy to ignore the large scale environmental disruption with its negative feedback on consumers and producers caused by growing pollution and excessive use of environmental resources in diagnosing the discrepancy between private and social cost as the cause of the problem the externality paradigm proved very useful the correct diagnosis implies the straightforward cure to internalise all external cost namely the damage cost of pollution but it is one thing to identify the qualitative nature of the problem at an abstract conceptual level and quite another thing to place specific money values on pollution damage and society's valuation of the environment respectively in the context of specific pollution control problems very often it is controversial not only how inefficient the no policy situation is but also what exactly the net benefit of any public action of reducing pollution is

human well being relies critically on ecosystem services provided by nature examples include water and air quality regulation nutrient cycling and decomposition plant pollination and flood control all of which are dependent on biodiversity they are predominantly public goods with limited or no markets and do not command any price in the conventional economic system so their loss is often not detected and continues unaddressed and unabated this in turn not only impacts human well being but also seriously undermines the sustainability of the economic system it is against this background that teeb the economics of ecosystems and biodiversity project was set up in 2007 and led by the united nations environment programme to provide a comprehensive global assessment of economic aspects of these issues this book written by a team of international experts represents the scientific state of the art providing a comprehensive assessment of the fundamental ecological and economic principles of measuring and valuing ecosystem services and biodiversity and showing how these can be mainstreamed into public policies this volume and subsequent teeb outputs will provide the authoritative knowledge and guidance to drive forward the biodiversity conservation agenda for the next decade

the environment has become exposed to a range of damaging contaminants from a wide variety of sources regulation of and legislation against offending parties has frequently been hampered because of the difficulty of co operation between disparate disciplines in the natural social and political sciences this volume forms the conclusion of five years collaboration between toxicologists economists and lawyers in the understanding and solution of the problem of accumulative chemicals as well as a case study of the accumulation of pesticides in groundwater in one particular region the european union the book forms a general study of the value of interdisciplinary approaches in environmental policy making the volume will be a valuable resource for a broad group of academics and researchers in the area of environmental science and environmental policy it will also form a useful supplementary reference text for courses in environmental policy science economics and toxicology

the purpose of this collection of essays is to shed some light on the complex relationship between environmental quality and the distribution of income are the preferences of the poor towards a cleaner environment really different from those of the rich environmental economists have traditionally focused on efficiency issues in their analyses the quality of the environment is usually related to aggregate or average variables like per capita income policy recommendations are usually formulated considering efficiency with no regard for equity and also the predicted effects of policies are evaluated in aggregate terms the essays

collected in this volume go into the problem of the relationship between environmental quality and income distribution the book's opening essay shows how different theories of economic growth and environmental quality seem to suggest that the higher the level of income the higher is the value of environmental protection the essays that follow a mix of already published papers and of papers solicited for this book analyse the relationship between environmental quality and income distribution from different perspectives both micro and macro and on the basis of more than one methodology this book highlights that the preferences of the poor towards a cleaner environment may differ from those of the rich but income is also very likely to represent only one factor affecting them the essays consider other relevant factors affecting preferences for environmental quality what clearly emerges is that the distribution of costs and benefits of environmental policies is the key for their successful implementation and that further research is needed to both address the distributional effects themselves and the strategies to mitigate them
