the most authoritative and comprehensive synthesis of modern econometrics available
econometrics provides first year graduate students with a thoroughly modern introduction to
the subject covering all the standard material necessary for understanding the principal
techniques of econometrics from ordinary least squares through cointegration the book is
distinctive in developing both time series and cross section analysis fully giving readers a
unified framework for understanding and integrating results econometrics covers all the
important topics in a succinct manner all the estimation techniques that could possibly be
taught in a first year graduate course except maximum likelihood are treated as special cases of

gmm generalized methods of moments maximum likelihood estimators for a variety of models such as probit and tobit are collected in a separate chapter this arrangement enables students to learn various estimation techniques in an efficient way virtually all the chapters include empirical applications drawn from labor economics industrial organization domestic and international finance and macroeconomics these empirical exercises provide students with hands on experience applying the techniques covered the exposition is rigorous yet accessible requiring a working knowledge of very basic linear algebra and probability theory all the results are stated as propositions so that students can see the points of the discussion and also the conditions under which those results hold most propositions are proved in the text for students who intend to write a thesis on applied topics the empirical applications in econometrics are an excellent way to learn how to conduct empirical research for theoretically inclined students the no compromise treatment of basic techniques is an ideal preparation for more advanced theory courses

this graduate level textbook deals with analyzing and forecasting multiple time series it considers a wide range of multiple time series models and methods the models include vector autoregressive vector autoregressive moving average cointegrated and periodic processes as well as state space and dynamic simultaneous equations models least squares maximum likelihood and bayesian methods are considered for estimating these models different procedures for model selection or specification are treated and a range of tests and criteria for evaluating the adequacy of a chosen model are introduced the choice of point and interval forecasts is considered and impulse response analysis dynamic multipliers as well as innovation accounting are presented as tools for structural analysis within the multiple time series context this book is accessible to graduate students in business and economics in addition multiple time series courses in other fields such as statistics and engineering may be based on this book applied researchers involved in analyzing multiple time series may benefit from the book as it provides the background and tools for their task it enables the reader to perform his or her analyses in a gap to the difficult technical literature on the topic

a complete course in applied macroeconomics at the intermediate level that emphasizes the application of economic theory to real world data and policy

this book is intended for a first year graduate course in econometrics however the first six chapters have no matrix algebra and can be used in an advanced undergraduate class this can be supplemented by some of the material in later chapters that do not require matrix algebra like the first part of chapter 11 on simultaneous equations and chapter 14 on time series analysis this book teaches some of the basic econometric methods and the underlying assumptions behind them estimation hypotheses testing and prediction are three recurrent themes in this book some uses of econometric methods include i empirical testing of economic theory whether it is the permanent income consumption theory or purchasing power parity ii forecasting whether it is gnp or unemployment in the u s economy or future sales in the computer industry iii estimation of price elasticities of demand or returns to scale in production more importantly econometric methods can be used to simulate the effect of policy changes like a tax increase on gasoline consumption or a ban on advertising on cigarette consumption

this reference work and graduate level textbook considers a wide range of models and methods

for analyzing and forecasting multiple time series the models covered include vector autoregressive cointegrated vector autoregressive moving average multivariate arch and periodic processes as well as dynamic simultaneous equations and state space models least squares maximum likelihood and bayesian methods are considered for estimating these models different procedures for model selection and model specification are treated and a wide range of tests and criteria for model checking are introduced causality analysis impulse response analysis and innovation accounting are presented as tools for structural analysis the book is accessible to graduate students in business and economics in addition multiple time series courses in other fields such as statistics and engineering may be based on it applied researchers involved in analyzing multiple time series may benefit from the book as it provides the background and tools for their tasks it bridges the gap to the difficult technical literature on the topic

designed to promote students understanding of econometrics and to build a more operational knowledge of economics through a meaningful combination of words symbols and ideas each chapter commences in the way economists begin new empirical projects with a question and an economic model then proceeds to develop a statistical model select an estimator and outline inference procedures contains a copious amount of problems experimental exercises and case studies

provides hands on experience of econometrics with estimation and inference each chapter begins with a discussion of economic theory underlying the application

accompanying cd rom contains data and sample computer code for empirical problems
