this second volume based on the excavations of the viking town kaupang 2000 2003 presents find types used in economic transactions coins hacksilver ingots weights and balances changes in type and volume of economic transactions at kaupang and in scandinavia are discussed and the economic mentality of viking crafts and tradesmen is explored earlier the study of viking silver currency was based mainly on hoards containing coins and hacksilver in this volume the combined study of the find types mentioned as well as the sophisticated chronology of settlements finds from sites like kaupang gives a completely new insight into economy and exchange in the early 9th century silver and goods seem to have come to kaupang mainly from the carolingian world silver weighed with locally produced lead weights was used as currency on a limited scale the old e unit was easily convertible to carolingian units after the mid 9th century this early system was altered the increased availability of silver caused by the import of islamic coins as well as the introduction in most of scandinavia in the 860s 870s of standardized weights of probable islamic origin paved the way from then on for an increasing use of silver as payment these studies demonstrate that sites like kaupang led the way in economic development in scandinavia the urban environment promoted an economic mentality which contributed significantly to the fundamental transformation of scandinavian culture and society which culminated in the region s integration in christian europe in the high middle ages

this monograph presents our recent results on the proportional integrative derivative pid controller and its design analysis and synthesis the focus is on linear time invariant plants that may contain a time delay in the feedback loop this setting captures many real world practical and industrial situations the results given here include and complement those published in structure and synthesis of pid controllers by datta ho and bhattacharyya 10 in 10 we mainly dealt with the delay free case the main contribution described here is the efficient computation of the entire set of pid controllers achieving stability and various performance specifications the performance specifications that can be handled within our machinery are classical ones such as gain and phase margin as well as modern ones such as hoo norms of closed loop transfer functions finding the entire set is the key enabling step to realistic design with several design criteria the computation is efficient because it reduces most often to linear programming with a sweeping parameter which is typically the proportional gain this is achieved by developing some preliminary results on root counting which generalize the classical hermite biehler theorem and also by exploiting some fundamental results of pontryagin on quasi polynomials to extract useful information for controller synthesis the efficiency is important for developing software design packages which we are sure will be forthcoming in the near future as well as the development of further capabilities such as adaptive pid design and online implementation
