during the last few decades the ideas methods and results of the theory of boolean algebras have played an increasing role in various branches of mathematics and cybernetics this monograph is devoted to the fundamentals of the theory of boolean constructions in universal algebra also considered are the problems of presenting different varieties of universal algebra with these

constructions and applications for investigating the spectra and skeletons of varieties of universal algebras for researchers whose work involves universal algebra and logic

the first of three parts comprising volume 54 the proceedings of the summer research institute on differential geometry held at the university of california los angeles july 1990 isbn for the set is 0 8218 1493 1 part 1 begins with a problem list by s t yau successor to his 1980 list sem

geometric topology is a foundational component of modern mathematics involving the study of spacial properties and invariants of familiar objects such as manifolds and complexes this volume which is intended both as an introduction to the subject and as a wide ranging resouce for those already grounded in it consists of 21 expository surveys written by leading experts and covering active areas of current research they provide the reader with an up to date overview of this flourishing branch of mathematics

these proceedings grew out of the sixth summer conference on general topolgy and applications held at long island university which drew 116 mathematicians from six continents and featured the first visit to the united states in 20 years of the renowned soviet topologist a v arhangel skii the power and diversity of these mathematicians is reflected in articles on subjects ranging from topological groups uniform structures and function spaces to lattices frames compactifications spatial decompositions metrisation combinational set theory and cleavability

minimal surfaces date back to euler and lagrange and the beginning of the calculus of variations many of the techniques developed have played key roles in geometry and partial differential equations examples include monotonicity and tangent cone analysis originating in the regularity theory for minimal surfaces estimates for nonlinear equations based on the maximum principle arising in bernstein s classical work and even lebesgue s definition of the integral that he developed in his thesis on the plateau problem for minimal surfaces this book starts with the classical theory of minimal surfaces and ends up with current research topics of the various ways of approaching minimal surfaces from complex analysis pde or geometric measure theory the authors have chosen to focus on the pde aspects of the theory the book also contains some of the applications of minimal surfaces to other fields including low dimensional topology general relativity and materials science the only prerequisites needed for this book are a basic knowledge of riemannian geometry and some familiarity with the maximum principle

minimal surfaces is the first volume of a three volume treatise on minimal surfaces grundlehren

nr 339 341 each volume can be read and studied independently of the others the central theme is boundary value problems for minimal surfaces the treatise is a substantially revised and extended version of the monograph minimal surfaces i ii grundlehren nr 295 296 the first volume begins with an exposition of basic ideas of the theory of surfaces in three dimensional euclidean space followed by an introduction of minimal surfaces as stationary points of area or equivalently as surfaces of zero mean curvature the final definition of a minimal surface is that of a nonconstant harmonic mapping $x: \Omega \rightarrow \mathbb{R}^3$ which is conformally parametrized on $\Omega \subset \mathbb{R}^2$ and may have branch points thereafter the classical theory of minimal surfaces is surveyed comprising many examples a treatment of björling's initial value problem reflection principles a formula of the second variation of area the theorems of bernstein heinz osserman and fujimoto the second part of this volume begins with a survey of plateau's problem and of some of its modifications one of the main features is a new completely elementary proof of the fact that area A and dirichlet integral D have the same infimum in the class C^1 of admissible surfaces spanning a prescribed contour γ this leads to a new simplified solution of the simultaneous problem of minimizing A and D in C^1 as well as to new proofs of the mapping theorems of riemann and korn lichtenstein and to a new solution of the simultaneous douglas problem for A and D where γ consists of several closed components then basic facts of stable minimal surfaces are derived this is done in the context of stable H surfaces i.e. of stable surfaces of prescribed mean curvature H especially of cmc surfaces $H = \text{const}$ and leads to curvature estimates for stable immersed cmc surfaces and to nitsche's uniqueness theorem andtomi's finiteness result in addition a theory of unstable solutions of plateau's problems is developed which is based on courant's mountain pass lemma furthermore dirichlet's problem for nonparametric H surfaces is solved using the solution of plateau's problem for H surfaces and the pertinent estimates

group theory and its applications volume iii covers the two broad areas of applications of group theory namely all atomic and molecular phenomena as well as all aspects of nuclear structure and elementary particle theory this volume contains five chapters and examines semisimple algebras algebras of quantum mechanical interest group algebras semisimple complex lie algebras frobenius algebra theory complex phase space and a theoretical approach to elementary particle interactions based on two variable expansions of reaction amplitudes this book will prove useful to mathematicians engineers physicists and advance students
