after an introductory chapter concerned with the history of force free magnetic fields and the relation of such fields to hydrodynamics and astrophysics the book examines the limits imposed by the virial theorem for finite force free configurations various techniques are then used to find solutions to the field equations the fact that the field lines corresponding to these solutions have the common feature of being twisted and may be knotted motivates a discussion of field line topology and the concept of helicity the topics of field topology helicity and magnetic energy in multiply connected domains make the book of interest to a rather wide audience applications to solar prominence models type ii superconductors and force reduced magnets are also discussed the book contains many figures and a wealth of material not readily available elsewhere

in this book a wide range of different topics related to analytical as well as numerical solutions of problems related to scattering propagation radiation and emission in different medium are discussed design of several devices and their measurements aspects are introduced topics related to microwave region as well as terahertz and quasi optical region are considered bi isotropic metamaterial in optical region is investigated interesting numerical methods in frequency domain and time domain for scattering radiation forward as well as reverse problems and microwave imaging are summarized therefore the book will satisfy different tastes for engineers interested for example in microwave engineering antennas and numerical methods
