this text provides an accessible self contained and rigorous introduction to complex analysis and differential equations topics covered include holomorphic functions fourier series ordinary and partial differential equations the text is divided into two parts part one focuses on complex analysis and part two on differential equations each part can be read independently so in essence this text offers two books in one in the second part of the book some emphasis is given to the application of complex analysis to differential equations half of the book consists of approximately 200 worked out problems carefully prepared for each part of theory plus 200 exercises of variable levels of difficulty tailored to any course giving the first introduction to complex analysis or differential equations this text assumes only a basic knowledge of linear algebra and differential and integral calculus moreover the large number of examples worked out problems and exercises makes this the ideal book for independent study

i entire functions of several complex variables constitute an important and original chapter in complex analysis the study is often motivated by certain applications to

specific problems in other areas of mathematics partial differential equations via the fourier laplace transformation and convolution operators analytic number theory and problems of transcendence or approximation theory just to name a few what is important for these applications is to find solutions which satisfy certain growth conditions the specific problem defines inherently a growth scale and one seeks a solution of the problem which satisfies certain growth conditions on this scale and sometimes solutions of minimal asymptotic growth or optimal solutions in some sense for one complex variable the study of solutions with growth conditions forms the core of the classical theory of entire functions and historically the relationship between the number of zeros of an entire function  $f(z)$  of one complex variable and the growth of  $|f(z)|$  or equivalently  $\log |f(z)|$  was the first example of a systematic study of growth conditions in a general setting problems with growth conditions on the solutions demand much more precise information than existence theorems the correspondence between two scales of growth can be interpreted often as a correspondence between families of bounded sets in certain frechet spaces however for applications it is of utmost importance to develop precise and explicit representations of the solutions

this book contains a selection of more than 500 mathematical problems and their solutions from the phd qualifying examination papers of more than ten famous american universities the problems cover six aspects of graduate school mathematics algebra differential geometry topology real analysis complex analysis and partial differential equations the depth of knowledge involved is not beyond the contents of the textbooks for graduate students while solution of the problems requires deep understanding of the mathematical principles and skilled techniques for students this book is a valuable complement to textbooks for lecturers teaching graduate school mathematics a helpful reference copyright libri gmbh all rights reserved

a first course in complex analysis with applications limits theoretical coverage to only what is necessary and conveys it in a student friendly style its aim is to introduce the basic principles and applications of complex analysis to undergraduates who have no prior knowledge of this subject contents of the book include the complex number system complex functions and sequences as well as real integrals in addition to other concepts of calculus and the functions of a complex variable this text is written for junior level undergraduate students who are majoring in math physics computer science and electrical engineering

in the pages that follow there are a a revised and enlarged version of problems in analysis pia all typographical stylistic and mathematical errors in pia and known to the writer have been corrected b a new section complex analysis containing problems distributed among many of the principal topics in the theory of functions of a complex variable c a total of 878 problems and their solutions d an enlarged index glossary and an enlarged symbol list notational and terminological conventions are to be found for the most part under conventions at the beginnings of the chapters spe cial items not included in conventions are completely explained in the index glossary the audience to which the current book is addressed differs little from the audience for pia the background of the reader is assumed to include a knowledge of the basic principles and theorems in real and complex analysis as those subjects are currently viewed the aim of the problems is to sharpen and deepen the understanding of the mechanisms that underlie modern analysis i thank springer verlag for its interest in and support of this project state university of new york at buffalo b r g v contents the symbol alb under pages below indicates that the problems for the section begin on page a and the corresponding solutions begin on page b thus 3 139 on the line for set algebra indicates that the problems in set algebra begin on page 3 and the corresponding solutions begin on page 139
