for centuries biologists have been extremely interested in the structure of desert plants as examples of natural selection to harsh environmental conditions indeed desert plants are frequently used as examples in many biology classes and

textbooks to illustrate natural selection but this has led to an unfortunate litany of errors and misconceptions about desert plant adaptations this new synthesis focuses on plants of lowland tropical and subtropical arid deserts readers will be surprised to discover that many features commonly ascribed to desert plants are rarely observed in the most common species instead the typical structural adaptations of nonsucculent warm desert plants are now viewed as ways to maximize photosynthetic rate

this is the second part of a two volume work which presents an authoritative world wide view of our knowledge about and understanding of hot desert ecosystems this includes some semi arid and arid areas as well as deserts in the strict sense the hot deserts are distinguished from the temperate deserts which form the subject of another volume in the series by the virtual absence of snowfall even though frosts may occur for each major hot desert region expert authors have summarized existing knowledge according to a general outline this includes descriptions of the ecosystem components climate soil flora and fauna and discussion of interaction between components and overall ecosystem functioning the information from the regional chapters has been integrated into a world wide view in the synthesis chapters because of its length the volume is published in two parts the first part included the general synthesis chapters and regional descriptions of the hot deserts of america and australia the present volume covers hot deserts of asia and africa

the author's clear instructions give even the inexperienced gardener all the necessary information to succeed people living outside the desert can also grow desert plants successfully

this introductory general ecology text features a strong emphasis on helping students grasp the main concepts of ecology while keeping the presentation more applied than theoretical an evolutionary perspective forms the foundation of the entire discussion the book begins with the natural history of the planet considers portions of the whole in the middle chapters and ends with another perspective of the entire planet in the concluding chapter its unique organization of focusing only on several key concepts in each chapter sets it apart from the competition

provides interesting and thought provoking reading and is highly recommended to anyone interested in desert ecosystems

or community ecology the book should serve as an inspiration to many for future research journal of biogeography this book is not just about deserts it is an update of the contributions that research in desert systems is making to community ecology this book will provide a useful reference for desert ecologists as well as indicate critical directions where progress needs to be made ecology this important book fills a significant gap in previous syntheses by presenting a detailed series of reviews of current understanding of community patterns and structure in desert environments each chapter is thorough and well written and closes with a discussion of suggested future research these ideas will do much to focus interest on the importance of desert systems in understanding community thus this book has interest well beyond desert ecologists alone bioscience valuable reading and reference for ecology students teachers and researchers quarterly review of biology
