this title was first published in 2000 did the plan of medieval churches have any underlying symbolic meaning this work re opens the debate about the importance of geometry and symbolism in medieval architectural design and argues the case for attributing an intellectual meaning to the planning of abbeys and cathedrals in challenging prevailing claims for the use of arithmetical rations in architectural design notably those based on the square root of two dr hiscock advances a perspective consisting of proportions derived from the figures of platonic geometry the square the equilateral triangle and the pentagon and provides evidence for the symbolic interpretation of these figures the investigation further reveals whole series of geometric relationships between some of england s most celebrated norman cathedrals such as norwich or durham together with a wide sample from the continent from old st peter s in rome to chartres cathedral and sets out a comprehensive design method in each case hiscock first demonstrates the proposition that the ideas of christian platonism including number and geometry remained current and were employed in the thought of the early middle ages in particular he argues that they can be associated with the leading persons in the 10th century revival of monasticism and that they found expression in the white mantle of churches that spread across western europe at the end of the first millennium ad the book then provides a detailed analysis of the geometric proportions of church plans between the 9th and 12th centuries in germany france and in

england this research seeks to demonstrate that a coherent sequence of geometric forms can be seen in thse plans forms which correspond to the key figures of platonic geometry as understood in the context of christian platonist thought in conclusion the author shows how the system of design proposed could be set out on site using the known working methods of medieval masons

the subject of partial differential equations pdes which first emerged in the 18th century holds an exciting and special position in the applications relating to the mathematical modelling of physical phenomena the subject of pdes has been developed by major names in applied mathematics such as euler legendre laplace and fourier and has applications to each and every physical phenomenon known to us e g fluid flow elasticity electricity and magnetism weather forecasting and financial modelling this book introduces the recent developments of pdes in the field of geometric design particularly for computer based design and analysis involving the geometry of physical objects starting from the basic theory through to the discussion of practical applications the book describes how pdes can be used in the area of computer aided design and simulation based design extensive examples with real life applications of pdes in the area of geometric design are discussed in the book

this book is a comprehensive tool both for self study and for use as a text in classical geometry it explains the concepts that form the basis for computer aided geometric design

multiresolution methods in geometric modelling are concerned with the generation representation and manipulation of geometric objects at several levels of detail applications include fast visualization and rendering as well as coding compression and digital transmission of 3d geometric objects this book marks the culmination of the four year eu funded research project multiresolution in geometric modelling mingle the book contains seven survey papers providing a detailed overview of recent advances in the various fields within multiresolution modelling and sixteen additional research papers each of the seven parts of the book starts with a survey paper followed by the associated research papers in that area all papers were originally presented at the mingle 2003 workshop held at emmanuel college cambridge uk 9 11 september 2003

this is a challenging problem solving book in euclidean geometry assuming nothing of the reader other than a good deal of courage topics covered included cyclic quadrilaterals power of a point homothety triangle centers along the way the reader will meet such classical gems as the nine point circle the simson line the symmedian and the mixtilinear incircle as well as the theorems of euler ceva menelaus and pascal another part is dedicated to the use of complex numbers and barycentric coordinates granting the reader both a traditional and computational viewpoint of the material the final part consists of some more advanced topics such as inversion in the plane the cross ratio and projective transformations and the theory of the complete quadrilateral the exposition is friendly and relaxed and accompanied by over 300 beautifully drawn figures the emphasis of this book is placed squarely on the problems each chapter contains carefully chosen worked examples which explain not only the solutions to the problems but also describe in close detail how one would invent the solution to begin with the text contains as selection of 300 practice problems of varying difficulty from contests around the world with extensive hints and selected solutions this book is especially suitable for students preparing for national or international mathematical olympiads or for teachers looking for a text for an honor class

this ambitious book explores the relationship between the western scientific revolution that began with galileo in the early seventeenth

century and the renaissance artistic revolution inaugurated by giotto three hundred years earlier the fruit of many years of thought and research it demonstrates the crucial role that italian renaissance painting sculpture and architecture played in what we call modern science samuel y edgerton jr shows that rather than being symptomatic in nature the arts served as a catalyst for the transformation in perception which occurred in the west in the fourteenth century according to edgerton the new way in which reality was represented through the use of the unique renaissance tools of perspective and chiaroscuro set the stage for modern scientific practice
