machines will gradually become programmed using computers which have the
knowledge of how the objects in the world relate to one another this book
capitalizes on the fact that products which are manufactured can be designed on
the computer and that information about the product such as its physical shape
provide powerful information to reason about how to develop the process plan for

their manufacture this book explores the whole aspect of using the principles of how parts behave naturally to automatically generate programs that govern how to produce them the last decade saw tremendous work on how machines can be programmed to perform a variety of tasks automatically robotics has witnessed the most work on programming techniques but it was not until the emergence of the advanced cad system as a proper source of information representation about objects which are to be manipulated by the robot that it became viable for automated processors to generate robot programs without human interface it became possible for objects to be described and for principles about how they interact in the world to be developed the functions which the features designed into the objects serve for the objects can be adequately represented and used in reasoning about the manufacturing of the parts using the robot this book describes the necessary principles which must be developed for a robot to generate its own programs with the knowledge of the world in the cad system

this book gathers the latest advances innovations and applications in the field of information technology in civil and building engineering presented at the 20th international conference on computing in civil and building engineering icccbe held in montreal canada on august 25 28 2024 it covers highly diverse topics such as bim construction information modeling knowledge management gis gps laser scanning sensors monitoring vr ar computer aided construction product and process modeling big data and iot cooperative design mobile computing simulation structural health monitoring computer aided structural control and analysis ict in geotechnical engineering computational mechanics asset management maintenance urban planning facility management and smart cities written by leading researchers and engineers and selected by means of a rigorous international peer review process the contributions highlight numerous exciting ideas that will spur novel research directions and foster multidisciplinary collaborations

this book provides a useful introduction to morse theory coverage focuses on applications and includes topics such as morse small flows min max theory moment maps and equivariant cohomology and complex morse theory

pneumatic hydraulic and allied instrumentation schemes have given way to electronic schemes in recent years thanks to the rapid strides in electronics and allied areas principles design and applications of such state of the art instrumentation schemes form the subject matter of this book through representative examples the basic building blocks of instrumentation schemes are identified and each of these building blocks discussed in terms of its design and

interface characteristics the common generic schemes synthesized with such building blocks are dealt with subsequently this forms the scope of part i the focus in part ii is on application displacement and allied instrumentation force and allied instrumentation and process instrumentation in terms of temperature flow pressure level and other common process variables are dealt with separately and exhaustively despite the diversity in the sensor principles and characteristics and the variety in the applications and their environments it is possible judiciously to carve out broad areas of application for each type of sensor and the instrumentation built around it the last chapter categorises instrumentation schemes according to their different levels of complexity specific practical examples especially at involved complexity levels are discussed in detail
