we are witnessing an ever increasing thrust toward the era of multimedia information networks largely spurred by the u s government s proposal for the national information infrastructure in the fall of 1993 while more people are subscribing to the services of narrowband isdn

the implementation of broadband isdn by means of asynchronous transfer mode atm has accelerated since the formation of the atm forum in 1993 in the meantime frame relay may prevail for inter lan connections in the upper layer of the network commercial use of internet is rapidly emerging to ensure the successful development of technology it is vital to use a judicious approach in assessing the architecture and performance of the systems that implement the technology it is this spirit that underlies the present conference which is intended to provide an international forum for the presentation of recent research results in the area of local and metropolitan communication systems this conference has two sets of predecessors it is the third in a series of international conferences on local and metropolitan communication systems lan man the first was held in toulouse in 1986 and the second in palma de mallorca in 1991 it is also the fourth in a triennial series organized by kyoto university and others on the performance of communication related systems the previous ones were held in tokyo 1985 and kyoto 1988 1991

the series is devoted to the publication of high level monographs and surveys which cover the whole spectrum of probability and statistics the books of the series are addressed to both experts and advanced students

recent years have witnessed tremendous growth in the population of mobile users demanding high performance reliability and quality of service qos wireless networks are undergoing rapid developments and dramatic changes in the underlying technologies in order to cope with the difficulties posed by the scarce wireless resource as well as keep up with the increasing day to day demand for cost effective service of multimedia applications predicting and optimising the performance and qos of wireless networks using analytical modelling simulation experiments monitoring and testbed based measurements are crucial to the proper design tuning resource management and capacity planning of such networks this book is dedicated to review important developments and results explore recent state of the art research and discuss new strategies for performance modelling analysis and enhancement of wireless networks the objective is to make analytical modelling simulation and measurement tools and innovative performance evaluation methodology possible and understandable to a wider audience

this book constitutes the refereed proceedings of the second international workshop on data engineering issues in e commerce and services deecs 2006 held in san francisco california june 2006 the book presents 15 revised full papers and 8 revised short papers organized in topical sections on e commerce services business processes and services data and knowledge engineering business models and analysis services and e commerce systems

defining means and methods designed to ensure the quality of service qos mechanisms which is the objective of the first part of this paper

involves a series of analytical or experimental modeling activities for example by simulation and analysis which in turn involve various mathematical disciplines such as probability theory and statistics in order to determine how to act considering the factors that influence the quality of service having a generous theoretical support each of these mentioned activities and instruments is a separate subject the exposure of which can be found in the following two parts of this paper this is the part ii which aims at presenting the basic analytical tools used in the description of random phenomena and the part iii dealing with the specific aspects of telecommunication services regarding the modeling and analysis processes for their quality

the international teletraffic congress itc is a recognized international organization taking part in the work of the international telecommunications union the congress traditionally deals with the development of teletraffic theory and its applications to the design planning and operation of telecommunication systems networks and services the contents of itc 14 illustrate the important role of teletraffic in the current period of rapid evolution of telecommunication networks a large number of papers address the teletraffic issues behind developments in broadband communications and atm technology the extension of possibilities for user mobility and personal communications together with the generalization of common channel signalling and the provision of new intelligent network services are further extremely significant developments whose teletraffic implications are explored in a number of contributions itc 14 also addresses traditional teletraffic subjects proposing enhancements to traffic engineering practices for existing circuit and packet switched telecommunications networks and making valuable original contributions to the fundamental mathematical tools on which teletraffic theory is based the contents of these proceedings accurately reflect the extremely wide scope of the itc extending from basic mathematical theory to day to day traffic engineering practices and constitute the state of the art in 1994 of one of the fundamental telecommunications sciences

selected papers from the specialist seminar of the adelaide international teletraffic congress are presented in this book together they give an excellent sample of the work being done around the world to define and meet the new challenges in teletraffic theory and practice although many questions are answered here the papers pose many more problems which are still to be solved many papers present methods for solving problems that will remain difficult even as computing speed increases exponentially the methods used include heuristic and ai approaches approximations simplifications new approaches to numerical analysis and simulation and some new techniques borrowed from other disciplines while some problems are hard to solve because of complexity others are difficult because of uncertainty some forms of uncertainty may be quantified and dealt with by using probability theory many examples may be found in this volume further papers show that stationary stochastic processes are now being challenged as other models are also tried

hardbound queueing models with the server's vacations and or priority based scheduling can be used for the performance evaluation of many computer and communication systems this book provides a comprehensive and accessible analysis of these queueing models in the framework of $M/G/1$ systems the method of imbedded markov chains the delay cycle analysis and the method of supplementary variables are extensively used to study the $M/G/1$ $M/G/1$ with vacations and $M/G/1$ with priorities only a basic understanding of queueing systems is assumed a comprehensive bibliography of books on queues and teletraffic engineering completes the volume
