an important graduate textbook in condensed matter physics by highly regarded physicist

fifty years ago a new approach to reaction kinetics began to emerge one based on mathematical models of reaction kinetics or
 formal reaction kinetics since then there has been a rapid and accelerated development in both deterministic and stochastic kinetics
 primarily because mathematicians studying differential equations and algebraic geometry have taken an interest in the nonlinear
 differential equations of kinetics which are relatively simple yet capable of depicting complex behavior such as oscillation chaos and
 pattern formation the development of stochastic models was triggered by the fact that novel methods made it possible to measure
 molecules individually now it is high time to make the results of the last half century available to a larger audience students of
 chemistry chemical engineering and biochemistry not to mention applied mathematics based on recent papers this book presents the
 most important concepts and results together with a wealth of solved exercises the book is accompanied by the authors mathematica
 package reactionkinetics which helps both students and scholars in their everyday work and which can be downloaded from extras
