the study reported in this paper is an ongoing effort we reported a preliminary analysis of the data in the paper the current experiments varied the subjects to conduct online group learning activities by the communication media such as email and threaded discussion although we could have easily learned the impact of mobile devices in learning if we divided the subjects to use different hardware such as personal computers personal digital assistant or mobile phones we believe our findings will still be able to provide useful insights on the difficulties that the mobile learners will face in solving problems as a group our analysis result will also provide baseline information on whether the traits of the successful or failed online groups are applicable to the mobile learners for example we expect the sms will be a better medium to overcome the major problem of instant communication or the rapid propagation of the information as the mobile phones have built in mechanism to remind the users of the incoming new messages and also the mobile phone users are expected to be interrupted for the incoming messages however we need further investigation of other problems which hinder the optimum online group work for example accuracy of the transferred information was identified as one of the problems of using emails as the communication medium personal digital assistant pda or sms are more apt to deliver shorter messages than the typical emails
