the engineering management discipline remains complex and multidisciplinary and has progressed and broadened in scope significantly over the last 10-20 years. Previously the discipline has been fragmented and not aligned with the purposes of economic development, mega project delivery and technological progress. Digital engineering has revolutionized the field of engineering by introducing digital tools and technologies to the design, creation, operation and maintenance of physical systems, products and services. It has enabled more efficient, effective and sustainable solutions and has the potential to drive significant innovation and improve the way we design, build and operate physical systems. This handbook addresses new content of complexity by offering new engineering concepts such as simple, complicated and complex, which have never been included in this discipline before and will generate interest from higher education, financial institutions and technology companies. Handbook of engineering management: The digital economy focuses on multidisciplinary integration and complex evolving systems. It discusses the incorporation of a system of systems along with engineering economic strategies for sustainable economic growth. This handbook highlights functional leadership as the main part of an engineering manager's competency and discusses how to form alliances strategically. In addition, it presents a comprehensive guide for the implementation of an environmental management system and shows how environmental and social impacts can be assessed in an organization applying digital tools. This handbook also brings together the three important areas of engineering management: knowledge management, the digital economy and digital manufacturing. In addition, this handbook provides a comprehensive guide to implementing an environmental management system and shows how environmental and social impacts in an organization can be assessed using digital tools based on the authors' practical experience. It describes various management approaches and explains how such a system can be used to prioritize actions and resources, increase efficiency, minimize costs and lead to better, more informed decision making. It is essential to follow a systematic approach and to ask the right questions whether the system is managed and implemented by humans, AI or a combination of both. This handbook is laid out in a series of simple steps and dispels the jargon and myths surrounding this important management tool. This handbook is an ideal read for engineering managers, project managers, industrial and systems engineers, supply chain engineers, professionals who want to advance their knowledge and graduate students.

Managing the dynamics of new product development processes merges product-based planning, process modelling, process execution, probabilistic simulations and simulation-based decision making into one framework called the dynamic new product development process. It provides readers with a means of improving the management of product development through enhanced methods and tools that are specifically tailored to the characteristics and challenges of such processes. It calls for a new product lifecycle management paradigm of utilizing the managed product data for management of the product's development process within the framework. The methods used are enhanced or modified to fit the new product development process requirements. Each specific method is exhaustively analyzed from the basic definition of terms through a description of the state of the art of that topic and its limitations. Then the method enhancements are illustrated by many examples and discussed while suggesting further research directions. Finally, the enhanced methods are integrated and demonstrated by a test case. The main two methods described are the design structure matrix (DSM) and Petri nets, which are merged into a novel concept entitled DSM nets. Managing the dynamics of new product development processes provides algorithms, proofs and practical examples that can be used for general study of the issues concerned. The main concepts presented are applicable to systems engineering and can be used by practitioners of product development processes such as designers, product managers and process managers, as well as developers of process management tools for systems with dynamically changing process structures.
