eliminate them from your facility describing the purpose and use of standard work it explains how to properly staff work cells and how to develop flex plans for fluctuations in demand using this data the first few chapters explain how to determine takt time and how to use that information along with time studies to identify when you are not meeting customer demand the chapters on jit kitting explain how there are other advantages to kitting besides eliminating waste and increasing productivity the book explains how you can use jit kitting to improve quality by having the parts available and limiting the options of numerous parts to the operator it also provides the understanding needed to ensure the right parts are installed thereby correcting issues with the build of materials

this second edition of the classic textbook has been written to provide a completely up to date text for students of mechanical industrial manufacturing and production engineering and is an indispensable reference for professional industrial engineers and managers in his outstanding book professor katsundo hitomi integrates three key themes into the text manufacturing technology production management industrial economics manufacturing technology is concerned with the flow of materials from the acquisition of raw materials through conversion in the workshop to the shipping of finished goods to the customer production management deals with the flow of information by which the flow of materials is managed efficiently through planning and control techniques industrial economics focuses on the flow of production costs aiming to minimise these to facilitate competitive pricing professor hitomi argues that the fundamental purpose of manufacturing is to create tangible goods and it has a tradition dating back to the prehistoric toolmakers the fundamental importance of manufacturing is that it facilitates basic existence it creates wealth and it contributes to human happiness

manufacturing matters nowadays we regard manufacturing as operating in these other contexts beyond the technological it is in this unique synthesis that professor hitomi s study constitutes a new discipline manufacturing systems engineering a system that will promote manufacturing excellence key features the classic textbook in manufacturing engineering fully revised edition providing a modern introduction to manufacturing technology production managment and industrial economics includes review questions and problems for the student reader

this book presents advances and innovations in grouping genetic algorithms enriched with new and unique heuristic optimization techniques these algorithms are specially designed for solving industrial grouping problems where system entities are to be partitioned or clustered into efficient groups according to a set of guiding decision criteria examples of such problems are vehicle routing problems team formation problems timetabling problems assembly line balancing group maintenance planning modular design and task assignment a wide range of industrial grouping problems drawn from diverse fields such as logistics supply chain management project management manufacturing systems engineering design and healthcare are presented typical complex industrial grouping problems with multiple decision criteria and constraints are clearly described using illustrative diagrams and formulations the problems are mapped into a common group structure that can conveniently be used as an input scheme to specific variants of grouping genetic algorithms unique heuristic grouping techniques are developed to handle grouping problems efficiently and effectively illustrative examples and computational results are presented in tables and graphs to demonstrate the efficiency and effectiveness of the algorithms researchers decision analysts software developers and graduate students from various disciplines will find this in depth

reader friendly exposition of advances and applications of grouping genetic algorithms an interesting informative and valuable resource

this paper describes the basic considerations required to generate and manage an assembly line balance within a manufacturing facility the problem of balancing an assembly line is observed in the form of a deterministic line balancing method the purpose is to search academically and experientially for improvement in the process of balancing production assembly lines the assembly line balance concepts are discussed in a predetermined hierarchy of importance as realized from the author s experience with and analysis of manufacturing organizations the suggestions throughout the study are intended to provide management personnel with a sense of self imposed objectives and perspective on the proper evaluation of the whole system and its components methods diagramming and modeling are inclusive essentials to support this research
