embryonic stem cell research holds unique promise for developing therapies for currently incurable diseases and conditions and for important biomedical research however the process through which embryonic stem cells are obtained involves the destruction of early human embryos katrien devolder focuses on the tension between the popular view that an embryo should never be deliberately harmed or destroyed and the view that embryonic stem cell research because of its enormous promise must go forward she provides an in depth ethical analysis of the major philosophical and political attempts to resolve this tension one such attempt involves the development of a middle ground position which accepts only types or aspects of embryonic stem cell research deemed compatible with the view that the embryo has a significant moral status an example is the position that it can be permissible to derive stem cells from embryos left over from in vitro fertilisation but not from embryos created for research others have advocated a technical solution several techniques have been proposed for deriving embryonic stem cells or their functional equivalents without harming embryos an example is the induced pluripotent stem cell technique through highlighting inconsistencies in the arguments for these positions devolder argues that the central tension in the embryonic stem cell debate remains unresolved this conclusion has important implications for the stem cell debate as well as for policies inspired by this debate
