our summary is short simple and pragmatic it allows you to have the essential ideas of a big book in less than 30 minutes as you read this summary you will discover that in nature altruism does not exist all living species are genetically selfish you will also discover that your genes have created you for their own survival that your children will be naturally selfish but that you have the means to change that through culture that in terms of reproduction the male is less involved than the female that since the appearance of modern man genetic evolution is no longer the only type of evolution in the world the selfish gene theory is another facet of darwin s theory rather than focusing on the individual organism it takes the point of view of genetics your genes survived in a world where competition was raging so the predominant quality in a gene that thrived is certainly ruthless selfishness a selfishness that inevitably affects individual behavior but by understanding what your genes are tending towards selfishness you may have a chance to counteract them and achieve what no other species has ever achieved becoming an altruistic individual are you ready to regain control of your identity buy now the summary of this book for the modest price of a cup of coffee

summary of the selfish gene in his book the selfish gene dawkins argues for the gene as the basic unit of evolution he claims that organisms are survival shells for the replicators within us replicators the units that evolve are genes they are inherently selfish in that they only care about their own survival and the survival of their copies as a result no true altruism exists anytime an organism helps another both sets of genes are benefiting dawkins expands his theory to attempt to explain topics like kin altruism eusociality group dynamics and culture he writes for the scientist looking for a new idea and for the layman just looking to learn more by explaining his theory in a way that appeals to all here is a preview of what you will get a full book summary an analysis fun quizzes quiz answers etc get a copy of this summary and learn about the book

summary of the selfish genes has the egocentric gene by richard dawkins been waiting for you on your study list choose the important thing ideas inside the e book with this brief summary over 3.5 billion years ago in a primordial soup of molecules the primary most effective form of life on the planet came to be a molecule able to reproduce itself a replicator molecular replicators are made from lengthy chains of smaller building block molecules in the same manner that a phrase is made up of a string of letters replicators reproduce themselves via attracting different letters and performing as a template for them to fit into the primary replicator routinely had a competitive edge over all the different

molecules within the primordial soup because they could not replicate themselves and subsequently the replicators have become more numerous than every other sort of molecule but mistakes inside the copying system led to daughter replicators that had a slightly different configuration than their parent these new configurations supposed that a few daughters had been able to reproduce themselves faster or more correctly giving them a competitive advantage over their parent an increasing number of replicators have been built from the finite deliver of constructing block molecules within the primordial soup and those molecules were step by step used up those two principles a population in which ability varies and an surroundings of restrained sources are the primary requirements for the system we recognize as evolution as time went on similar mistakes in copying resulted in new high quality traits inclusive of the capacity to interrupt other replicators and use their constructing blocks for replication the primary carnivores through the introduction of latest variations and the survival of the replicators with the maximum beneficial blessings greater complex existence forms emerged in the end ensuing in the type of organisms we see today here is a preview of what you will get a full book summary an analysis fun quizzes quiz answers etc get a copy of this summary and learn about the book

richard dawkins provides excellent examples of his reasoning and interpretation skills in the selfish gene his 1976 book is not a work of original research but instead a careful explanation of evolution combined with an argument for a particular interpretation of several aspects of evolution since dawkins is building on other researchers work and writing for a general audience the central elements of good reasoning are vital to his book producing a clear argument and presenting a persuasive case organising an argument and supporting its conclusions in doing this dawkins also employs the crucial skill of interpretation understanding what evidence means clarifying terms questioning definitions giving clear definitions on which to build arguments the strength of his reasoning and interpretative skills played a key part in the widespread acceptance of his argument for a gene centred interpretation of natural selection and evolution and in its history as a bestselling classic of science writing

about the book in a 2006 interview with meet the author the year when the selfish gene celebrated its 30th anniversary richard dawkins had this to say if i had to write it again i wouldn t write it very differently it has been described as a revolutionary book in one respect it is but it s only a revolutionary way in looking at orthodox darwinian natural selection it helps to look at it in this revolutionary way it could equally well have been called the altruistic animal because if you have selfish genes which only means that natural selection works at the level of the gene if you have selfish genes then you may have altruistic individuals and that s what the book is about what dawkins describes as revolutionary others have construed as controversial when the selfish gene was first published in 1976 it created a number of waves within the study evolutionary biology largely dominated by darwinian doctrine one could say it made a splash in the gene pool if darwin s idea of natural selection was based on the concept of survival of the fittest then why does altruism exist between individuals why aren t all living things selfish in a cut throat battle for survival dawkins strove to explain altruism in the selfish gene with the argument that altruistic behavior can be explained through the selfishness of our genes excerpt from the book if it runs away chase it if it comes at you fight back in a relationship such as prey versus predator dawkins explains possible strategies a retaliator doesn t attack aggressively but will act in a threatening manner if the opponent attacks first the retaliator will as

you guessed retaliate retaliators behave based upon their opponent's behavior making them conditional strategists in addition to retaliators there are two other kinds of conditional strategies bullies and prober retaliators a bully attacks until an opponent strikes back in which case the bully immediately retreats prober retaliators are essentially retaliators but can initiate an attack like a bully and if the opponent fights back will defend itself in these strategies the retaliator is an ess the prober retaliator is nearly stable and the bully is not stable chapter 6 genemanship the key point of this chapter is that genes might be able to assist replicas of itself that are sitting in other bodies if so this would appear as individual altruism but it would be brought about by gene selfishness 88 in the previous chapter dawkins explained aggression through individual independent selfish machines however individuals have relatives in the form of siblings cousins parents etc all of whom share many of the same genes each selfish gene then has its loyalties divided among different individuals the selfish gene is every replica of itself dawkins explains how a gene selected for kin altruism could survive in the gene pool a gene that suicidally saves five cousins would not be numerous in a population of individuals however if it saved five brothers or ten first cousins would the minimum requirement for a suicidal altruistic gene to be a successful one in the gene pool would have to save more than two siblings children parents more than four half siblings uncles aunts nephews nieces grandparents grandchildren or more than eight first cousins etc
