questions about variation similarity enumeration and classification of musical structures have long intrigued both musicians and mathematicians mathematical models can be found from theoretical analysis to actual composition or sound production increasingly in the last few decades musical scholarship has incorporated modern mathematical content one example is the application of methods from algebraic combinatorics or topology and graph theory to the classification of different musical objects however these applications of mathematics in the understanding of music have also led to interesting open problems in mathematics itself the reach and depth of the contributions on mathematical music theory presented in this volume is significant each contribution is in a section within these subjects i algebraic and combinatorial approaches ii geometric topological and graph theoretical approaches and iii distance and similarity measures in music

this book introduces path breaking applications of concepts from mathematical topology to music theory topics including harmony chord progressions rhythm and music classification contributions address topics of voice leading tonnetze maps of notes and chords and automatic music classification focusing on some geometrical and topological aspects of the representation and formalisation of musical structures and processes the book covers topological features of voice leading geometries in the most recent advances in this mathematical approach to representing how chords are connected through the motion of voices leading to analytically useful simplified models of high dimensional spaces it generalizes the idea of a tonnetz a geometrical map of tones or chords and shows how topological aspects of these maps can correspond to many concepts from music theory the resulting framework embeds the chord maps of neo riemannian theory in continuous spaces that relate chords of different sizes and includes extensions of this approach to rhythm theory it further introduces an application of topology to automatic music classification drawing upon both static topological representations and time series evolution showing how static and dynamic features of music interact as features of musical style this volume will be a key resource for academics researchers and advanced students of music music analyses music composition mathematical music theory computational musicology and music informatics it was originally published as a special issue of the journal of mathematics and music

this book presents and discusses the fundamental topic of classification of musical objects such as chords motifs and gestures their classification deals with the exhibition of isomorphism classes our structure types include local and global constructions the latter being similar to global structures in geometry such as differentiable manifolds the discussion extends to the role which classification plays for the creative construction of musical compositions our examples include references to classical compositions such as beethoven s sonatas and some of the author s own compositions of classical and jazz styles we also discuss software that enables the application of classification to musical creativity the volume is addressed to an audience that would apply classification to programming and creative musical construction
