this substantially enlarged second edition aims to lead a further stage in the computational revolution in commutative algebra this is the first handbook tutorial to extensively deal with singular among the book s most distinctive features is a new completely unified treatment of the global and local theories another feature of the book is its breadth of coverage of theoretical topics in the portions of commutative algebra closest to algebraic geometry with algorithmic treatments of almost every topic

motivated by some notorious open problems such as the jacobian conjecture and the tame generators problem the subject of polynomial automorphisms has become a rapidly growing field of interest this book the first in the field collects many of the results scattered throughout the literature it introduces the reader to a fascinating subject and brings him to the forefront of research in this area some of the topics treated are invertibility criteria face polynomials the tame generators problem the cancellation problem exotic spaces dna for polynomial automorphisms the abhyankar moh theorem stabilization methods dynamical systems the markus yamabe conjecture group actions hilbert s 14th problem various linearization problems and the jacobian conjecture the work is essentially self contained and aimed at the level of beginning graduate students exercises are included at the end of each section at the end of the book there are appendices to cover used material from algebra algebraic geometry d modules and gröbner basis theory a long list of strong examples and an extensive bibliography conclude the book

this book develops the machinery of homological algebra and its applications to commutative rings and modules it assumes familiarity with basic commutative algebra for example as covered in the author s book commutative algebra the first part of the book is an elementary but thorough exposition of the concepts of homological algebra starting from categorical language up to the construction of derived functors and spectral sequences a full proof of the celebrated freyd mitchell theorem on the embeddings of small abelian categories is included the second part of the book is devoted to the application of these techniques in commutative algebra through the study of projective injective and flat modules the construction of explicit resolutions via the koszul complex and the properties of regular sequences the theory is then used to understand the properties of regular rings cohen macaulay rings and modules gorenstein rings and complete intersections overall this book is a valuable resource for anyone interested in learning about homological algebra and its applications in commutative algebra the clear and thorough presentation of the material along with the many examples and exercises of varying difficulty make it an excellent choice for self study or as a reference for researchers

the papers in this volume contain results in active research areas in the theory of rings and modules including non commutative and commutative ring theory module theory representation theory and coding theory

shafarevich s basic algebraic geometry has been a classic and universally used introduction to the subject since its first appearance over 40 years ago as the translator writes in a prefatory note for all advanced undergraduate and beginning graduate students and for the many specialists in other branches of math who need a liberal education in algebraic geometry shafarevich s book is a must the second volume is in two parts book ii is a gentle cultural introduction to scheme theory with the first aim of putting abstract algebraic varieties on a firm foundation a second aim is to introduce hilbert schemes and moduli spaces that serve as parameter spaces for other geometric constructions book iii discusses complex manifolds and their relation with algebraic

varieties kähler geometry and hodge theory the final section raises an important problem in uniformising higher dimensional varieties that has been widely studied as the shafarevich conjecture the style of basic algebraic geometry 2 and its minimal prerequisites make it to a large extent independent of basic algebraic geometry 1 and accessible to beginning graduate students in mathematics and in theoretical physics

power series provide a technique for constructing examples of commutative rings in this book the authors describe this technique and use it to analyse properties of commutative rings and their spectra this book presents results obtained using this approach the authors put these results in perspective often the proofs of properties of classical examples are simplified the book will serve as a helpful resource for researchers working in commutative algebra
