this volume examines the origin of eukaryotic cells both phylogenetically and morphogenetically the evolutionary relationship between prokaryotic and eukaryotic organizations is emphasized the difference of inferences from ribosomal rna and protein phylogenetic trees suggests a new possibility of synthesizing an evolutionary origin of eukaryotic cells as integrating morphogenetic contributions

an important reason for our western thought that the japanese have had no independence in philosophy is our ignorance of the larger part of japanese and chinese literature oriental speculation was moving in a direction so diverse from that of the west that we are impressed more with the general similarity that prevails throughout it than with the evidences of individual differences greater knowledge would reveal these differences in our generalized knowledge we see the uniformity so strongly that we fail to discover the originality from chapter xvi american educator and missionary sidney lewis gulick 1860 1945 spent his life building a bridge between east and west during a period of immense confusion between the two diverse traditions during the more than 25 years he spent in japan as a teacher and lecturer in a variety of subjects including english and religion he learned as much about japanese society as he taught about western culture and midway through his sojourn in the slowly modernizing nation he wrote this forgotten classic of social science first published in 1903 evolution of the japanese is a startling clear eyed assessment of a foreign way of life yet one that evinces an atypical awareness on the writer s part of his own cultural assumptions about everything from the relative position of women and the habits of marital relationships to such traits of national character as cheerfulness industry jealousy and suspicion art and family intellectualism and morality religion and philosophy gulick discusses them all in this intriguing work one that reveals as much about the western mind at the turn of the 20th century as it does about the eastern

the cerebellum is an intriguing component of the brain in humans it occupies only 10 of the brain volume yet has approximately 69 billion neurons that is 80 of the nerve cells in the brain the cerebellum first arose in jawed vertebrates such as sharks and early vertebrates also have an additional cerebellum like structure in the hindbrain shark cerebellum like structures function as adaptive filters to discriminate self from other in sensory inputs it is likely that the true cerebellum evolved from these cerebellum like precursors and that their adaptive filter functionality was adopted for motor control paving the way for the athleticism and movement finesse that we see in swimming running climbing and flying vertebrates this book uses an evolutionary perspective to open up the

exciting body of work that is cerebellar research to a wide audience understanding the brain is of interest to many people from many different backgrounds and for many different reasons therefore understanding cerebellum is a significant step towards the wider challenge of understanding the brain this book will be of interest to neuroscientists neurologists and psychologists in addition to computer scientists and engineers concerned with machine human interactions and robotics

this volume provides a fascinating account of the natural forces which shaped the island's landscape from its formation some 500 million years ago to the present nature of the manx environment and landscape the story of the island's colonisation by plants and animals sets the scene for the later volumes which deal with the impact of man's arrival a key element of the volume is an in depth examination of the contemporary landscape with an appraisal of how the environment has affected man and how man has affected the environment

studies of brain evolution have moved rapidly in recent years building on the pioneering research of harry j jerison this book provides reviews of primate including human brain evolution the book is divided into two sections the first gives new perspectives on the developmental physiological dietary and behavioural correlates of brain enlargement it has long been recognized however that brains do not merely enlarge globally as they evolve but that their cortical and internal organization also changes in a process known as reorganization species specific adaptations therefore have neurological substrates that depend on more than just overall brain size the second section explores these neurological underpinnings for the senses adaptations and cognitive abilities that are important for primates with a prologue by stephen j gould and an epilogue by harry j jerison this is an important reference work for all those working on brain evolution in primates
