volume 1 focuses on the evolution of central europe from the precambrian to the permian a dynamic period which traces the formation of central europe from a series of microcontinents that separated from gondwana through to the creation of pangaea separate summary chapters on the cadomian caledonian and

variscan orogenic events as well as on palaeozoic magmatism provide an overview of the tectonic and magmatic evolution of the region these descriptions sometimes extend beyond the borders of central europe to take in the scottish and irish caledonides as well as the palaeozoic successions in the baltic region

the first of a two volume set this text focuses on the evolution of central europe from the precambrian to the permian a dynamic period which traces the formation of central europe from a series of microcontinents that separated from gondwana through to the creation of pangaea separate summary chapters on the cadomian caledonian and variscan orogenic events as well as on palaeozoic magmatism provide an overview of the tectonic and magmatic evolution of the region

the southern permian basin as its name suggests is a historical heartland for hydrocarbon production from the palaeozoic rotliegend interval however in this mature basin the mesozoic presents further possibilities to offer resource security to nw europe such opportunities include increasing efficiency in the production of discovered hydrocarbons exploration for further hydrocarbons both conventional and unconventional and efficient exploration for and production of geothermal energy all these potential resources require a grounding in technically sound geoscience via traditional scientific observation and the application of new technologies to unlock their value the main aim of this volume is to bring together the work of academics and industry workers to consider cross border geoscience including contributions on poland germany the netherlands the united kingdom and adjacent areas the work presented intends to contribute to the development and discovery of further mesozoic energy resources across the basin

all too often geology is not applied when it should be with disastrous or unnecessarily expensive consequences the aim of this book is to improve communication between geologists and decision makers to demonstrate the types of problems to which geological information and expertise are relevant and to indicate the great volume of national and international information that is available more than 230 geologists from 21 national geological surveys and associated institutions have collaborated to provide a summary of the geology the natural resources and the geological hazards of western europe together with examples of the benefits of applying geological techniques to understanding conserving and developing the environment each chapter gives a concise but informative summary of the subject concerned backed up by a series of case studies while its geological content will be of interest to earth scientists generally the book is accessible to nonspecialists and is intended to bridge the gap between geologists and all those concerned with the environment including national and local policymakers planners teachers and administrators

europe provides an outstanding field laboratory for studying lithospheric processes through time for tracing the tectonic evolution of crust and mantle from the present far back into the early precambrian two things are particularly striking the importance of plate tectonics during the phanerozoic and through the proterozoic into the archaean and the significance of tectonic inheritance older structures and rheologies guiding the younger evolution european lithosphere dynamics grew out of a major european science foundation programme europa with participation of many hundreds of earth scientists from all over

Europe the main research activities focused on specific target areas and involved integration of geological geophysical and geochemical methods defining surface depth relationships was a prerequisite for interpretation of the processes present and past responsible for the formation of the lithosphere

Volume 2 provides an overview of the Mesozoic and Cenozoic evolution of Central Europe. This period commenced with the destruction of Pangaea and ended with the formation of the Alps and Carpathians and the subsequent ice ages. Separate summary chapters on the Permian to Cretaceous tectonics and the alpine evolution are also included. The final chapter provides an overview of the fossils, fuels, ore and industrial minerals in the region.

Vols 1-108 include proceedings of the society separately paged beginning with v 30
