economic performance of a country is generally being measured through gdp gross domestic product a variable that has also become the de facto universal metric for standards of living however gdp does not properly account for social and environmental costs and benefits it is also difficult to achieve sustainable decision making aiming at sustainable progress and well being if welfare is being considered from a purely financial point of view the study highlights the benefits and some of the shortcomings of gdp it serves as a helpful and practicable instrument for monetary and fiscal policies the real problem presumably is that gdp growth is too often confused with sustainable welfare growth in people s minds while there certainly is a correlation between the two this study shows that this is a highly conditional correlation void of substantial causality for gdp levels observable in the european union in order to be able to assess people s well being and general sustainable development in the sense of sustainability an alternative instrument going beyond gdp is necessary using so called swot analyses several alternative progress indicators have been assessed in the context of this study on the one hand it was analysed how far ecological and social factors can be integrated in the gdp measurements thereby difficulties arose then trying to monetise these factors as a further possibility indicators were analysed which are to replace gdp as a whole the category supplementing gdp seems to be the most realistic and acceptable option for going beyond gdp within this approach gdp is being complemented with additional environmental and or social information in order to make this kind of solution feasible the study claims the establishment of an overarching and

transparent indicator system for improving economic decision making in support of sustainable development
