concepts embody our knowledge of the kinds of things there are in the world tying our past experiences to our present interactions with the environment they enable us to recognize and understand new objects and events concepts are also relevant to understanding domains such as social situations personality types and even artistic styles yet like other phenomenologically simple cognitive processes such as walking or understanding speech concept formation and use are maddeningly complex research since the 1970s and the decline of the classical view of concepts have greatly illuminated the psychology of concepts but persistent theoretical disputes have sometimes obscured this progress the big book of concepts goes beyond those disputes to reveal the advances that have been made focusing on the major empirical discoveries by reviewing and evaluating research on diverse topics such as category learning word meaning conceptual development in infants and children and the basic level of categorization the book develops a much broader range of criteria than is usual for evaluating theories of concepts

and deconstruction how have humans constructed these concepts and once they have been constructed by adults how do children acquire them while primarily focusing on the second question in the origin of concepts susan carey shows that the answers to both overlap substantially carey begins by characterizing the innate starting point for conceptual development namely systems of core cognition representations of core cognition are the output of dedicated input analyzers as with perceptual representations but these core representations differ from perceptual representations in having more abstract contents and richer functional roles carey argues that the key to understanding cognitive development lies in recognizing conceptual discontinuities in which new representational systems emerge that have more expressive power than core cognition and are also incommensurate with core cognition and other earlier representational systems finally carey fleshes out quinian bootstrapping a learning mechanism that has been repeatedly sketched in the literature on the history and philosophy of science she demonstrates that quinian bootstrapping is a major mechanism in the construction of new representational resources over the course of childrens cognitive development carey shows how developmental cognitive science resolves aspects of long standing philosophical debates about the existence nature content and format of innate knowledge she also shows that understanding the processes of conceptual development in children illuminates the historical process by which concepts are constructed and transforms the way we think about philosophical problems about the nature of concepts and the relations between language and thought
