this book showcases ian hacking s early ideas on the central issues surrounding statistical reasoning presented in a fresh twenty first century series livery and with a specially commissioned new preface this influential work is now available for a new generation of readers in statistics philosophy of science and philosophy of maths

a straightforward presentation of the four different statistical methods of inductive inference with discussion of the basic technical and mathematical material methods are examined from both philosophical and critical standpoints

anyone involved in the philosophy of science is naturally drawn into the study of the foundations of probability different interpretations of probability based on competing philosophical ideas lead to different statistical techniques and frequently to mutually contradictory consequences this unique book presents a new interpretation of probability rooted in the traditional interpretation that was current in the 17th and 18th centuries

mathematical models are constructed based on this interpretation and statistical inference and decision theory are applied including some examples in artificial intelligence solving the main foundational problems nonstandard analysis is extensively developed for the construction of the models and in some of the proofs many nonstandard theorems are proved some of them new in particular a representation theorem that asserts that any stochastic process can be approximated by a process defined over a space with equiprobable outcomes

while probabilistic logics in principle might be applied to solve a range of problems in practice they are rarely applied perhaps because they seem disparate complicated and computationally intractable this programmatic book argues that several approaches to probabilistic logic fit into a simple unifying framework in which logically complex evidence is used to associate probability intervals or probabilities with sentences specifically part i shows that there is a natural way to present a question posed in probabilistic logic and that various inferential procedures provide semantics for that question while part ii shows that there is the potential to develop computationally feasible methods to mesh with this framework the book is intended for researchers in philosophy logic computer science and statistics a familiarity with mathematical concepts and notation is presumed but no advanced knowledge of logic or probability theory is required

published papers whose appeal lies in their subject matter rather than their technical statistical contents medical social educational legal demographic and governmental issues are of particular concern
