although they are central objects in the theory of diophantine equations the zeta functions of hasse weil are not well understood one large class of varieties whose zeta functions are perhaps within reach are those attached to discrete groups generically called shimura varieties the techniques involved are difficult representation theory and harmonic analysis the trace formula and endoscopy intersection cohomology and  $H^2$  cohomology and abelian varieties with complex multiplication the simplest shimura varieties for which all attendant problems occur are those attached to unitary groups in three variables over imaginary quadratic fields referred to in this volume as picard modular surfaces the contributors have provided a coherent and thorough account of necessary ideas and techniques many of which are novel and not previously published

the external signals that control cellular behavior are channelled through cell surface receptors that in turn regulate cytoplasmic signaling pathways work over the last ten years has indicated that the activation of these intra cellular signaling pathways depends on a series of protein protein and protein phospholipid interactions mediated by modular polypeptide domains through their association with specific peptide motifs these protein modules define a recognition code through which many aspects of cellular function are controlled the articles in this book describe the varied features of these domains and outline the structural biochemical and genetic evidence that demonstrates their importance in co ordinating cellular responses to external cues
