this book examines the history of creative applications of photovoltaic pv solar power including sound art wearable technology public art industrial design digital media building integrated design and many others the growth in artists and designers incorporating solar power into their work reflects broader social economic and political events as the cost of pv cells has come down they have become more accessible and have found their way into a growing range of design applications and artistic practices as climate change continues to transform our environment and becomes a greater public concern the importance of integrating sustainable energy technologies into our culture grows as well the book will be of interest to scholars working in art history design history design studies environmental studies environmental humanities and sustainable energy design

a solar car is a specialized type of car designed for race and powered by sun energy solar this is obtained from solar panels on the surface of the vehicle photovoltaic pv cells convert the sun s energy directly into electric energy solar vehicles are not sold as practical day to day transportation devices at present but are primarily demonstration vehicles and engineering exercises it have limited seating usually one sometimes two people it have very little cargo capacity and only be driven during the day chassis is one of the important parts and every car passenger has it this structure was the biggest component in the car and car shape dependent on it it has a considerable affected to the performance of the car the primary challenge in developing an effective solar car chassis is to maximize the strength but minimize the weight there are various types of chassis each with its own advantages and disadvantages every extra pound requires more energy to move down the road this means that chassis must strive to minimize weight and a key area is the chassis however safety is a primary concern and the chassis must meet stringent strength and safety requirements as the conclusion this project had achieves its entire objective successfully this project was done around twelve week included almost all steps of the report such as literature review design analysis process and others

designing with photovoltaics cover a broad range of topics related to the design of products buildings and vehicles with integrated photovoltaic pv technologies including storage aspect it enables the reader to easily design new products buildings and vehicles through use of innovative pv products diverse categories of product integrated pvs are discussed including applications of solar power for mobility and building integrated systems along with design and manufacturing related information about solar cells illustrating design cases of various pv powered products special attention is paid to end users and environmental aspects of pv applications aimed at senior undergraduates graduates and professionals in electrical engineering architecture design physics mechanical engineering and those specifically studying photovoltaics it covers the different product integrated photovoltaics pipv with a focus on design and manufacturing presents comprehensive overview of all aspects of designing with photovoltaics includes product integrated pv building integrated pv and solar powered mobility concepts contains real design cases showing how to design with photovoltaics discusses context of environmental issues and user aspects

this report shows the design and analysis of body parts for racing solar cars because this play an important role in the motor industry today and solar car also powered by sun energy solar this is obtained from solar panels on the surface of the vehicle photovoltaic pv cells convert the sun's energy directly into electric energy this is project use the materials type as carbon fiber overall this project involves many processes starting from the design concept in this project design is very long time and this part most important in solar car industry secondly start the analyzing the parts of the body because the body plays a role in absorbing solar energy as possible as well the car body design aerodynamic

this report presents on the design of upper body structure for solar car solar car uses solar energy from the sun to convert it into electrical energy in order to move the solar car in order to move the solar car smoothly the shape of solar car's body must be more aerodynamics to get low drag and reduce the friction at the same time the objective of this report is to propose several design of solar car's body and analyze the models for drag coefficient and justify the most aerodynamics model the report describes the aerodynamics concept use in common cars computational fluid dynamics cfd analysis to calculate the drag coefficient and identify material and dimension of solar car

the dimension for the project is guided by world solar challenge regulations 2009 technical specifications fibreglass kevlar and carbon fiber materials were studied in this report which is commonly used in nowadays solar car the models of solar car were designed by using the computer aided drawing software which is solid work the cfd analysis was then performed using cosmosflowworks each model of solar car was analyzed using different mesh and speed of the air flow finally the drag force of each model is obtained and used in the calculation to find coefficient of drag for each model from the result it is observed that frontal area and shape of the solar car s body are the most important parameter to be considered in order to design an aerodynamics car besides designing the aerodynamics shape of solar car the choice of material for body can also affect the performance of the vehicle because different material will contribute the weight of the vehicle as the vehicle is lighter it will improve the vehicle power to weight ratio thus improve the performance of the vehicle

solar cars explores the potential of solar powered vehicles examining how photovoltaic technology could revolutionize transportation and address environmental concerns like carbon emissions the book delves into the integration of solar energy into vehicle design highlighting advancements in solar cell technology and the engineering challenges involved in creating functional solar cars one intriguing aspect is the potential of materials science to develop lightweight efficient solar panels this technology promises a sustainable alternative to traditional combustion engines and even battery electric vehicles the book takes a fact based approach presenting information clearly and accessibly it begins with the fundamentals of solar energy and photovoltaic conversion before moving to an overview of existing solar car designs the core sections investigate technological innovations like thin film solar cells engineering challenges such as aerodynamic drag and economic viability considering manufacturing costs and environmental impact the analysis is supported by data from scientific studies engineering reports and industry analyses the target audience includes engineers scientists students and policymakers interested in renewable energy and sustainable transportation by offering a balanced assessment solar cars provides valuable insights into the future of solar powered vehicles and their role in reducing our reliance on fossil fuels

the solar car power system consists of three main subsystems which are the solar array battery management and lastly battery pack it is arguably the most essential system of a solar car since it generates power for the car thus vastly influences the functionality of the car

itself this project was carried out to design a solar car power system that is feasible cost effective and in compliance with the rules and regulations of the 2011 world solar challenge wsc the main objective of this project was to design an electrical layout of a solar car power system with components that are properly selected as well as carrying out analysis to determine the practicality and compatibility of the design the design of the power system was divided into four levels which were the selection of subsystems main components design of the subsystems the conditioning of the power system and finally the design of the overall power system itself these steps involved drawing of design calculations and analysis of compatibility within the power system the drawings involved in the design of the system were done via solidworks 2010 and smartdraw 2010 softwares the finalized design delivered a power system that could generate a maximum power of 837 6w through its solar array designed by tabbed monocrystalline solar cells the power generated would be stored in a battery pack which consists of five vrla batteries with a combined power capacity of 6 4kwh a buck type maximum power point tracker configures the input from the solar array to the battery pack motor controller of the actuation system would configure the power system to continuously supply 1kw to the motor it is calculated that in ideal conditions the power system can continuously power the motor for at least 11 99 hours which is already sufficient for a day of solar racing the results and discussion concluded that the design of the solar car power system is feasible to be implemented and is considerably cost effective within the financial prowess of the university through proper justifications the design is also proven to be compatible within the system itself for further improvements in the future this project should be conducted with a greater budget so that rather than coming up with a conceptual design a fabrication or at least a better form of design simulation can be done besides that with greater budget better components that are more costly are then affordable

suspension is a necessary system for solar cars because it protects the frame and other on board components from large jolts encountered along highways if the suspension is too soft energy is wasted by absorbing the motion of a car as it travels over bumps for increased efficiency most solar cars use a suspension that is stiffer than normal for this project the solar car has two front wheels and one rear wheel the front wheels provide turning so the front suspension needs to let the wheels turn the suspension also allows the wheels to move up and down as the car runs over bumps the type of front suspension for this project is a double wishbone system it has a pair of an a frames one above the other mounted to the top and bottom of the wheel hub a separate spring until then sits between either the hub itself or one of the wishbones and the body to control the wheel movement lastly this car uses a trailing arm on rear suspension this kind of suspension has only one link arm on each side which puts greater structural requirements on it strong bending forces in all directions especially during cornering must be withstood by this suspension and as well as breaking camber and steer torques nevertheless trailing arm suspension has been used in many vehicles as a rear linkage because it requires little space to be accommodated
