for anyone who needs an intuitive and practical approach to the design and appropriate sizing of load bearing structures this book describes the complete panorama of supporting structures and their function by describing how loads are sustained and transmitted to the ground

this book aims at providing students of civil engineering with basic skill of structural analysis to determine internal forces as well as deflection of statically determinate planar structures it covers major structural types of trusses beams and frames three pinned arches and cables are also covered to complete the coverage of statically determinate structures as for deflection of structures the use of moment area method and conjugate beam method are covered the effect of moving load on structures under the topic of influence line is also included the emphasis of the book is on development of students ability to formulate procedures needed to solve statically determinate problem importance of using appropriate free body diagrams to assist in the process of analysis is emphasized through the use of diagrams in the examples given in the book the students are expected to be able to develop

proficiency of solving for internal forces and deflections through the worked examples given in the book apart from quantitative analysis an important skill of qualitative analysis through sketching of qualitative deflected shape based on bending moment diagram is also covered

presenting a comprehensive overview of recent developments in the field of seismic resistant steel structures this volume reports upon the latest progress in theoretical and experimental research into the area and groups findings in the following key sections performance based design of structures structural integrity under exceptional loading material and member behaviour connections global behaviour moment resisting frames passive and active control strengthening and repairing codification design and application

structural engineering is central to the design of a building how the building behaves when subjected to various forces the weight of the materials used to build it the weight of the occupants or the traffic it carries the force of the wind etc is fundamental to its stability the alliance between architecture and structural engineering is therefore critical to the successful design and completion of the buildings and infrastructure that surrounds us yet structure is often cloaked in mathematics which many architects and surveyors find difficult to understand how structures work has been written to explain the behaviour of structures in a clear way without resorting to complex mathematics this new edition includes a new chapter on construction materials and significant revisions to and reordering of the existing chapters it is aimed at all who require a good qualitative understanding of structures and their behaviour and as such will be of benefit to students of architecture architectural history building surveying and civil engineering the straightforward non mathematical approach ensures it will also be suitable for a wider audience including building administrators archaeologists and the interested layman
