the peaceful use of space flight systems for research and technological developments in the context of promoting european and international cooperation represents the essential motivation for the programmes of the european space agency esa one of esa's programmes is dedicated to microgravity research which is now an established discipline in europe with a dedicated group of scientists participating the challenger disaster has resulted in a serious discontinuity of flight opportunities in the next few years but the forthcoming international space station new launchers and reentry vehicles are expected to provide ample opportunities for microgravity research in the long term meanwhile parabolic aircraft flights sounding rockets as well as the delayed shuttle dependent missions spacelab d 2 the iml missions and eureka i will be employed to keep microgravity experimenters reasonably busy in the interim period to prepare the ground for these activities both regarding research and experiment facilities an in depth analysis of the state of the art is an essential requirement at this time such an analysis is presented in this volume it addresses all of the topics that have been identified to be of relevance besides a presentation of the fundamental aspects justifying microgravity research the results of experiments already performed are reviewed and recommendations for future activities are made close to fifty european scientists have cooperated in the preparation of this volume and their dedicated and concerted effort is greatly appreciated

in this volume we have collected a series of reviews that cover both experimental and theoretical work geared toward the more exact requirements of current sfc applications while we have artificially divided the volume into experimental and theoretical sections natural overlaps will be apparent many of the papers on experimental and theoretical sections natural overlaps will be apparent many of the papers on experimental technique contain discussions on equation of state correlations indeed a good deal of the experimental work is intimately tied to a mathematical description of fluid mixtures the theoretical section presents reviews that cover the modern theory of

critical phenomena methods to correlate near critical experimental results and approaches to understanding the behavior of near critical fluids from microscopic theory it is hoped that the scope of these reviews will provide the reader with the basis to further develop our understanding of the behavior of supercritical fluids
