with the advent of a host of new materials ranging from shape memory alloys to biomaterials
to multiphase alloys acquiring the capacity to model inelastic behavior and to choose the
right model in a commercial analysis software has become a pressing need for practicing
engineers even with the traditional materials there is a continued emphasis on optimizing
and extending their full range of capability in the applications this textbook builds upon
the existing knowledge of elasticity and thermodynamics and allows the reader to gain
confidence in extending one's skills in understanding and analyzing problems in
inelasticity by reading this textbook and working through the assigned exercises the reader
will gain a level of comfort and competence in developing and using inelasticity models
thus the book serves as a valuable book for practicing engineers and senior level
undergraduate graduate level students in the mechanical civil aeronautical metallurgical
and other disciplines the book is written in three parts part 1 is primarily focused on
lumped parameter models and simple structural elements such as trusses and beams this is
suitable for an advanced undergraduate class with just a strength of materials background
part ii is focused on small deformation multi dimensional inelasticity and is suitable for
a beginning graduate class sufficient material is included on how to numerically implement
an inelastic model and solve either using a simple stress function type of approach or
using commercial software case studies are included as examples there is also an extensive
discussion of thermodynamics in the context of small deformations part iii focuses on more

advanced situations such as finite deformation inelasticity thermodynamical ideas and crystal plasticity more advanced case studies are included in this part this textbook takes a new task or scenario based approach to teaching and learning inelasticity the book is written in an active learning style that appeals to engineers and students who wish to design or analyze structures and components that are subject to inelasticity the book incorporates thermodynamical considerations into the modeling right from an early stage extensive discussions are provided throughout the book on the thermodynamical underpinnings of the models this textbook is the first to make extensive use of matlab to implement many inelasticity models it includes the use of concepts such as airy stress functions to solve plane problems for inelastic materials the matlab codes are listed in the appendix for one to modify with their own models and requirements step by step procedures for formulations and calculations are provided for the reader to readily adapt to the inelastic problems that he or she attempts to solve a large number of problems exercises and projects for one to teach or learn from are included these can be assigned as homework in class exercises or projects the book is written in a modular fashion which provides adequate flexibility for adaptation in classes that cater to different audiences such as senior level students graduate students research scholars and practicing engineers

collaborative networks for a sustainable world aiming to reach a sustainable world calls for a wider collaboration among multiple stakeholders from different origins as the changes needed for sustainability exceed the capacity and capability of any individual actor in recent years there has been a growing awareness both in the political sphere and in civil society including the business sectors on the importance of sustainability therefore this is an important and timely research issue not only in terms of systems design but also as an effort to borrow and integrate contributions from different disciplines when designing and engineering those systems the discipline of collaborative networks especially which has already emerged in many application sectors shall play a key role in the implementation of effective sustainability strategies provide 2010 focused on sharing knowledge and experiences as well as identifying directions for further research and development in this area the conference dressed models infrastructures support tools and governance principles developed for collaborative networks as important resources to support multi stakeholder sustainable developments furthermore the challenges of this theme open new research directions for cns provide 2010 held in st

mechanical behaviour of materials iv is a collection of papers dealing with engineering issues of the strength of materials solid mechanics and materials science one paper analyzes the growth of subcritical cracks subject to cyclic stresses as a result of fatigue

or material microstructure another paper shows the retention of maximum strength of some aircraft parts which have been in service for up to 20 years and subjected to stress and exposure cycles due in part to the usage of high quality surface paint one paper discusses the regularities in deformation and failure of structural steels and alloys at cryogenic temperatures under conditions of static and cyclic low cycle loading the paper shows that the type of stress is evident in materials which lose their plastic properties as the temperature decreases the materials parameters that affect plastic instability and sheet formability are strain hardening strain rate sensitivity and plastic anisotropy experiments indicate the importance of stress state large strains and path changes on the strain hardening response and subsequent stability of the material another paper describes the relationship between microstructure and hydrogen embrittlement in aspects of fracture mechanics as well as the correlation between hydrogen embrittlement and carbon equivalent the collection can prove valuable for structural engineers materials engineers design engineers and investigators involved in the study of the strength of materials
