this book provides a fundamental understanding of the analytic process involved in solving complex problems such as the influence of geometric nonlinearity on buckling vibration and second order displacements because the book assumes linear behavior the solution can be evaluated using matrix math computer software however must be used to account for possible nonlinear material behavior due to the local yielding of the members that would result in changes to the elements of the stiffness matrix hence the computer solution must be iterative the number of iterations and the iteration interval may be set manually by the user or internally by the software which can affect the solution

wood is the major building material in residential structures this work reflects the 2006 building code nds standards and asce load standard it is aimed at civil engineers and architects and students

bamboo is in the spotlight as a potential building material in the current pursuit of a co2 neutral society due to its rapid maturation and excellent mechanical properties despite the growing interest in bamboo in academia and society there is a lack of systematic understanding of the fabrication design and construction processes using bamboo as a modern industrial material this is the first book to describe a new category of structural systems constructed with engineered bamboo it gives a definition of engineered bamboo glubam in an analogy with steel structures and wood structures structural systems and components have been designed using glubam then industrialized production processes of glubam are described based on state of the art research design guidelines are suggested in a comparable and parallel approach to the existing guidelines for composite wood structures the book also discusses bamboo structures in the context of sustainable development including the benefits of using bamboo as an alternative or replacement for wood especially for developing countries many of which are faced with the lack or destruction of forest resources
