~~cervical cancer is the second most common form of cancer found in women and it is~~
responsible for more than a quarter of a million deaths worldwide each year with approximately
70 of cervical cancers now known to be caused by two types of the human papilloma virus hpv
there is great interest surrounding the approval of the first preventative vaccines for clinical use
despite this excitement many questions remain about how the new vaccines should best be
implemented and how cervical cancer screening will change following vaccination part of the
oxford oncology library series this practical handbook provides an overview of the role of hpv in
the pathology of cervical cancer and its current screening and management the principles of
immune control of hpv infection in cervical cancer and the challenges of implementing hpv
vaccines and future developments

human papillomavirus hpv is one of the most common viral infections worldwide affecting
millions of people regardless of age gender or background despite its prevalence there remains
a significant lack of awareness and understanding about the virus leading to widespread
misconceptions and stigma hpv is primarily transmitted through skin to skin contact most
commonly through sexual activity and has been linked to various health conditions including
genital warts and several forms of cancer understanding the nature of hpv its impact and the
available preventive measures is essential in reducing its spread and minimizing its long term
health consequences hpv is not a single virus but a group of over 200 related viruses some of
which are considered low risk and cause mild conditions like warts while others are high risk
and associated with cancers such as cervical anal and throat cancer the high risk strains
particularly hpv 16 and hpv 18 are responsible for the majority of hpv related cancers because
hpv infections often do not present symptoms many individuals carry the virus unknowingly
increasing the likelihood of transmission however in most cases the body's immune system
clears the virus naturally within a couple of years while persistent infections pose a higher risk
of developing serious complications

~~Hopkins University Press 2010 Paperback Paperback after considering the aging population in developed countries it has become clear to physicians and public policy administrators that prevention of cancer must play a more important role in national anti cancer policy than it has in the past the recent introduction of an hpv vaccine coupled with discoveries concerning the relationship of h pylori and cancer has brought the role of infectious agents in cancer into sharp focus in the medical community while interest in the subject has grown no single source existed to bring clinicians up to date on developments in disease mechanisms population based risk assessment and policy considerations in the field of cancer prevention in this current and comprehensive text the authors review the basic science and clinical implications of individual infectious agents while going beyond a mere update of the literature to offer insights on the current emerging prevention possibilities this prevention perspective is what makes this particular text so valuable to researchers epidemiologists health care policy makers and oncologists the discussion is organized to highlight the vital role of primary cancer prevention and suggest directions for future research practice and policy since hpv continues to be at the center of interest in the arena of infectious agents and cancer the authors frame the majority of their discussion on this now famous virus the sheer volume of literature related to this virus and its many related cancers and the burgeoning research on the development and implementation of a prophylactic vaccine necessitates a much fuller review of this infectious agent therefore the book is roughly divided into two equal parts one part devoted to hpv and another part devoted to five other prominent infectious agents in cancer~~

the research landscape in relation to human papillomavirus hpv infection has evolved rapidly since the causal association between the virus and cervical cancer was made in the 1970s cervical screening programmes have resulted in a dramatic decrease in the incidence of cervical cancer the first vaccine for hpv was licensed in 2006 with real world data demonstrating high levels of vaccine efficacy
