this book is intended as a manual on modern advanced statistical methods for signal processing the objectives of signal processing are the analysis synthesis and modification of signals measured from different natural phenomena including engineering applications as well often the measured signals are affected by noise distortion and incompleteness and this makes it difficult to extract significant signal information the main topic of the book is the extraction of significant information from measured data with the aim of reducing the data size while keeping the basic information knowledge about the peculiarities and properties of the analyzed system to this aim advanced and recently developed methods in signal analysis and treatment are introduced and described in depth more in details the book covers the following new advanced topics and the corresponding algorithms including detailed descriptions and discussions the eigen coordinates ecs method the statistics of the fractional moments the quantitative universal label qul and the universal distribution function for the relative fluctuations udf the generalized prony spectrum the non orthogonal amplitude frequency analysis of the

smoothed signals nafass the discrete geometrical invariants dgi serving as the common platform for quantitative comparison of different random functions although advanced topics are discussed in signal analysis each subject is introduced gradually with the use of only the necessary mathematics and avoiding unnecessary abstractions each chapter presents testing and verification examples on real data for each proposed method in comparison with other books here it is adopted a more practical approach with numerous real case studies

selected plenary lectures new catalysts for controlled living atom transfer radical polymerization atp catalysis and applications of gold nanoparticles oral presentations ionic liquids as new solvents and catalysis for petrochemical and refining processes high throughput experiment on the investigation of oxidation catalysts with gas sensor system poster presentations development of a low temperature dioxin decomposition catalyst studies on unique properties of polyolefins prepared with metallocene catalyst systems index

this book is about the stirling engine and its development from the heavy cast iron machine of the nineteenth century into the efficient high speed engine of today it is not a handbook it does not tell the reader how to build a stirling engine it is rather the history of a research effort spanning nearly fifty years together with an outline of principles some technical details and descriptions of the more important engines no one will dispute the position of philips as the pioneer of the modern stirling engine hence the title of the book hence also the contents which are confined largely to the philips work on the subject valuable work has been done elsewhere but this is discussed only marginally in order to keep the book within a reasonable size the book is addressed to a wide audience on an academic level the first two chapters can be read by the technically interested layman but after that some engineering background and elementary mathematics are generally necessary heat engines are traditionally the engineer s route to thermodynamics in this context the stirling engine which is the simplest of all heat engines is more suited as a practical example than either the steam engine or the internal combustion engine the book is also addressed to historians of technology from the viewpoint of the twentieth century revival of the stirling engine as well as its nineteenth century origins
