perspective this book is important to everyone concerned with the design and development of people oriented systems the manpower and personnel integration manprint program is a major military system procurement initiative adopted by the army to focus on the needs and capabilities of the soldier this program is unique in that it integrates six areas of user concerns which include human factors engineering manpower personnel training health hazards and system safety throughout the development cycle of army materiel even though man print was developed for army systems the philosophy and techniques used in this program extend well beyond military systems used by soldiers it can be applied to all products and systems used by people such as automobiles airplanes boats control rooms automated manufacturing telecommunications computers and medical equipment interestingly the impetus for man print came from the senior managers who buy these systems during the early and mid 1980s two army generals m r thurman and r m elton who served successively as the deputy chief of staff for personnel were instrumental in fostering manprint development by the end of the 1980s this program was integrated throughout the standard procurement system of the army the formal statement of acquisition policy is contained in army regulation 602 2

human factors measurement has characteristics that set it apart from psychological or engineering measurement and for that reason human factors testing and evaluation deserves special treatment the many excellent texts available in the behavioral area do not give an adequate picture of this topic and this is particularly unfortunate because testing and evaluation t e is an integral part of human machine system design and operation the emphasis in this book is on why and how to conduct such testing one of its outstanding features is its pragmatism based on his past experience in system testing the author recognizes the difficulties that occur in testing and indicates how these may be overcome or minimized special attention has been paid to the context in which t e is conducted although the book contains detailed procedures for performing t e the logic and the conceptual foundation of testing have not been overlooked comparisons are made with laboratory centered experimentation for those with research interests the author points out the many research questions that can be answered by system testing an illustrative case history of a t e program for a fictional system has been included to provide real life context special problem areas in t e are emphasized in particular human error data collection the evaluation of computerized systems and software the measurement of maintenance technician and team performance workload and training effectiveness testing special attention is also paid to environmental testing e g temperature lighting noise vibration etc one chapter reviews all the relevant t e literature including government documents that may not be readily available to the general reader as part of the preparation for writing this text a survey was made of 45 distinguished t e specialists in order to determine their characteristic t e practices the book will be useful not only to the human factors professional who specializes in t e but to all students and practitioners interested in human factors and work measurement

abstract the thesis project is an investigation of some well known machine learning systems and evaluates their utility when applied to a classification task from the field of human genetics this common disease research task an inquiry into genetic and biochemical factors and their association with a family history of coronary artery disease cad is more complex than many pursued in machine learning research due to interactions and the inherent noise in the dataset the task also differs from most pursued in machine

learning research because there is a desire to explain the dataset with a small number of rules even at the expense of accuracy so that they will be more accessible to medical researchers who are unaccustomed to dealing with disjunctive explanations of data furthermore there is assymetry in the task in that good explanations of the positive examples is of more importance than good explanations of the negative examples the primary machine learning approach investigated in this research is genetic algorithms ga s decision trees autoclass and cobweb are also included the ga performed the best in terms of descriptive ability with the common disease research task although decision trees also demonstrated certain strengths autoclass and cobweb were recognized from the onset as being inappropriate for the needs of common disease researchers because both systems are unsupervised learners that create probabilistic structures but were included for their interest in the machine learning community these systems did not perform as well as ga s and decision trees in terms of their ability to describe the data in terms of predictive accuracy all systems performed poorly and the differences between any two of the three best systems is not significant when positive and negative examples are considered separately the ga does significantly better than the other systems in predicting positive examples and significantly worse in predicting negative examples the thesis illustrates that the investigation of real problems from researchers in other fields can lead machine learning researchers to challenge their systems in ways they may not otherwise have considered and may lead these researchers to a symbiotic relationship that benefits multiple research communities
