the past half century has seen an extraordinary growth in the fields of cellular and molecular biology from simple morphological concepts of cells as the essential units of living matter there has been an ever sharper focus on functional organization of living systems with emphasis on molecular dynamics thus life forms have come to be defined increasingly in terms of metabolism growth reproduction and responses to environmental perturbations since these properties occur in varying degrees in systems below the level of cellular organization there has been a blurring of older models that restricted the concepts of life to cellular systems at the same time a search has begun for elemental aspects of molecular and atomic behavior that might better define properties common to all life forms this search has led to an examination of nonlinear behavior in biological macromolecules whether in response to electrical or chemical stimulation for example or as a means of signaling along a molecular chain or as a means of energy transfer experimental knowledge in this area has grown rapidly in the past decade and in some respects has outstripped theoretical models adequate to explain these new observations nevertheless it can be claimed that there is now an impressive body of experiments implicating non linear nonequilibrium processes as fundamental steps in sequential operations of biological systems

this account of information theory the means by which biological information is transmitted from generation to generation is written for students of all branches of natural sciences it gives a comprehensive description and connects the various sciences involved the argument put forward is that man cannot be the result of some mechanistic coincidence there must be a plan underlying the evolution of life which extends darwin s theory of the survival of the fittest and which is reflected by modern ecology the author intends to persuade the reader to feel respect and admiration for the magnificent world of living beings

the genomic revolution has opened up systematic investigations and engineering designs for various life forms systems biology and synthetic biology are emerging as two complementary approaches which embody the breakthrough in biology and invite application of engineering principles systems biology and synthetic biology emphasizes the similarity between biology and engineering at the system level which is important for applying systems and engineering theories to biology problems this book demonstrates to students researchers and industry that systems biology relies on synthetic biology technologies to study biological systems while synthetic biology depends on knowledge obtained from systems biology approaches

this book examines life not from the reductionist point of view but rather asks the questions what are the universal properties of living systems and how can one construct from there a phenomenological theory of life that leads naturally to complex processes such as reproductive cellular systems evolution and differentiation the presentation is relatively non technical to appeal to a broad spectrum of students and researchers

in recent years experimental and numerical studies have shown that chaos is a widespread phenomenon throughout the biological hierarchy ranging from simple enzyme reactions to ecosystems although a coherent picture of the fundamental mechanisms responsible for chaotic dynamics has started to appear it is not yet clear what the implications of such dynamics are for biological systems in general in some systems it appears that chaotic dynamics are associated with a pathological condition in other systems the pathological condition has regular periodic dynamics whilst the normal non pathological condition has chaotic dynamics since chaotic behaviour is so ubiquitous in nature and since the phenomenon raises some fundamental questions about its implications for biology it seemed timely to organize an interdisciplinary meeting at which leading scientists could meet to exchange ideas to evaluate the current state of the field and to stipulate the guidelines along which future research should be directed the present volume contains the contributions to the nato advanced research workshop on chaos in biological systems held at dyffryn house st nicholas cardiff u k december 8 12 1986 at this meeting 38 researchers with highly different backgrounds met to present their latest results through lectures and posters and to discuss the applications of non linear techniques to problems of common interest in spite of their involvement in the study of chaotic dynamics for several years many of the participants met here for the first time

this series is designed for junior undergraduates and diploma students in all biological sciences covering the field of modern biochemistry and integrating animal plant and microbial topics this volume focuses on the generation of biologically usable energy in living systems

the book presents nine mini courses from a summer school dynamics of biological systems held at the university of alberta in 2016 as part of the prestigious seminar series séminaire de mathématiques supérieures sms it includes new and significant contributions in the field of dynamical systems and their applications in biology ecology and medicine the chapters of this book cover a wide range of mathematical methods and biological applications they explain the process of mathematical modelling of biological systems with many examples introduce advanced methods from dynamical systems theory present many examples of the use of mathematical modelling to gain biological insight discuss innovative methods for the analysis of biological processes contain extensive lists of references which allow interested readers to continue the research on their own integrating the theory of dynamical systems with biological modelling the book will appeal to researchers and graduate students in applied mathematics and life sciences

reflecting the major advances that have been made in the field over the past decade this book provides an overview of current models of biological systems the focus is on simple quantitative models highlighting their role in enhancing our understanding of the strategies of gene regulation and dynamics of information transfer along signalling pathways as well as in unravelling the interplay between function and

evolution the chapters are self contained each describing key methods for studying the quantitative aspects of life through the use of physical models they focus in particular on connecting the dynamics of proteins and dna with strategic decisions on the larger scale of a living cell using e coli and phage lambda as key examples encompassing fields such as quantitative molecular biology systems biology and biophysics this book will be a valuable tool for students from both biological and physical science backgrounds

the novartis foundation series is a popular collection of the proceedings from novartis foundation symposia in which groups of leading scientists from a range of topics across biology chemistry and medicine assembled to present papers and discuss results the novartis foundation originally known as the ciba foundation is well known to scientists and clinicians around the world

this symposium was not only a happy event for the university of nebraska but it marked a milestone in the history of the biological sciences here the symposium celebrated in the most appropriate way possible the creation of the new school of life sciences and ushered in what i believe will be a period of substantial development for biology on this campus i am immensely proud of the faculty of this new school and i have every confidence that the school's reputation and achievements will continue to grow as you all know this university has had and still has distinguished scientists in the biological sciences and has offered fine programs at both the undergraduate and graduate level but both the formation of the school of life sciences and the construction of the new life sciences building promise a brighter future in this important area the school of life sciences was formed from the departments of botany micro biology and zoology together with staff members in biochemistry from both the department of chemistry and from the former department of biochemistry and nutrition in the college of agriculture as well as staff members in the college of agriculture's department of plant pathology our whole notion was to build a core unit in biology that would cross the lines between the college of arts and sciences and the college of agriculture in order to combine strengths which exist in both areas

this book is devoted to the question what fundamental ideas and concepts can physics contribute to the analysis of complex systems like those in biology and ecology the book originated from two lectures which i gave during the winter term 1974/75 and the summer term 1976 at the Rheinisch-Westfälische Technische Hochschule in Aachen the wish for a lecture with this kind of subject was brought forward by students of physics as well as by those from other disciplines like biology physiology and engineering sciences the students of physics were looking for ways which might lead them from their monodisciplinary studies into the interdisciplinary field between physics and life sciences the students from the other disciplines suspected that there might be helpful physical concepts and ideas for the analysis of complex systems they ought to become acquainted with it is clear that a lecture or a book which tries to realize the expectations of both these groups will meet with difficulties arising from the different trainings and background knowledge of physicists and nonphysicists for the physicists i have tried to give a brief description of the biological aspect and significance of a problem wherever it seems necessary and appropriate and as far as a physicist like me feels authorized to do so
