the problem of metrization of topological spaces has had an enormous influence on the development of general topology singling out the basic topological components of metrizability has determined the main reference points in the construction of the classification of topological spaces these are primarily paracompactness collectionwise normality monotonic normality and perfect normality the concepts of a stratifiable space moore space and u space point countable base and uniform base the method of covers has taken up a leading role in this classification of paramount significance in the applications of this method have been the properties of covers relating to the character of their elements open covers closed covers the mutual disposition of these elements star finite point finite locally finite covers etc as well as the relations of refinement between covers simple refinement refinement with closure combinatorial refinement star and strong star refinement on this basis a hierarchy of properties of paracompactness type has been singled out together with the classes of spaces corresponding to them the most important of which is the class of paracompacta the behaviour of families of covers with respect to the topology of a space has important significance here first and foremost is the notion of a refining family of covers a development which appears in several modifications and together with the notion of paracompactness plays a key role in metrization problems

deep neural networks have demonstrated great success in many computer vision applications where intelligent recognition and analysis are performed based on high dimensional visual data however in contrast to the rapid development of advanced architectures and training schemes developments have been limited in the theory of analyzing deep neural networks and deep learning training through the lens of geometries the lack of such analysis prevents further understanding and affects the acceptance of deep neural networks for practical applications for example deep neural networks are often challenged by their vulnerability to adversarial attacks their lack of systematic guarantees on effectiveness and stability and their degraded

generalization capability outside the distribution of training data

this book is designed for the reader who wants to get a general view of the terminology of general topology with minimal time and effort the reader whom we assume to have only a rudimentary knowledge of set theory algebra and analysis will be able to find what they want if they will properly use the index however this book contains very few proofs and the reader who wants to study more systematically will find sufficiently many references in the book key features more terms from general topology than any other book ever published short and informative articles authors include the majority of top researchers in the field extensive indexing of terms

the aim of these lecture notes is to give an essentially self contained introduction to the basic regularity theory for energy minimizing maps including recent developments concerning the structure of the singular set and asymptotics on approach to the singular set specialized knowledge in partial differential equations or the geometric calculus of variations is not required a good general background in mathematical analysis would be adequate preparation
