this book is the product of a course that was developed to meet a horrifying requirement introduce aerospace engineering a k a rocket science to students who are fresh out of high school assume no background in calculus graphics computing or college physics or chemistry well the wright brothers did not have a e degrees either and they flew just fine in a craft that still amazes designers several senior students taking aircraft design helped me with the standards that had to be met a book received as birthday present told me the specifications of a new airliner advice at a party on why first year students are different came in very handy indeed on the first day several senior colleagues populated the back row of the auditorium purportedly to learn but possibly in anticipation of seeing me falling on my face the students were told that they would be flying their own airliner designs inside 6 weeks whatever they thought of that they just smiled and did it so can you hundreds of aerospace engineers have gone through the decades of course experience that now provide the backdrop of this book the key is for the learner to have a certain amount of faith that there is a method to what looks like madness it is undeniable that many students who come through the introduction course then and now do better designs and demonstrate more comfort in the basic disciplines than what the seniors could do in a prior era somewhere along the way students got tired of designing transonic airliners and wanted to go straight into their own supersonic planes and spacecraft and so they did there is no magic here just a simplified explanation of how requirements are laid out a first guess is made and how that that is used to successively reduce uncertainty about every part of the vehicle and its life cycle the rigorous analysis that comes in the various disciplines of aerospace engineering is glimpsed but not allowed to drown the learner at this stage if the book succeeds perhaps it may inspire a designer who will make the next generation of supersonic airliners happen among many other dreams that await determined effort to realize them

the world that lies in store for us over the next 25 years will surely challenge our received wisdom about how to protect american interests and advance american values with these words the commission on national security in the 21st century captured the exciting challenges this study sets out to explore first this study develops a generalized model for united states military transformations in peacetime to develop the model the author combines observations made by several historians about recurrent trends in military strategic innovation the author concludes that after taking into account inevitable uncertainty there are three identifiable factors that occur in most cases of military transformation the three key factors are the need for a coherent congruent vision an emerging culture that bolsters the vision and develops competing theories of victory to fulfill the vision and a process for honestly assessing the maturing vision and its supporting theories of victory after defining the limitations of the model and its usefulness the author applies the framework to an important aspect of national security the future of space power the framework is used to study the recent approach to space power from a civilian policy and military application perspective application of the transformation model highlights some important points about the present approach for developing space power first the civilian vision is not completely congruent with the military vision and the military vision is inconsistent second the military primarily the air force has made moderate but hesitant progress towards nurturing a space power culture with some unexpected consequences third the military has an uncoordinated haphazard approach to assessment that blurs the merit of the space power vision and associated theories
