recent oceanic data and observations from five coastal sites in the national weather service
solar radiation network are compared with a formula for computing clear sky insolation
derived from the smithsonian meteorological tables using a transmission coefficient of 0.7
the results are generally in good agreement and they suggest that this formula is suitable
for computing insolation over the ocean for a wide range of latitudes the comparison also
indicates that a correction to the formula for middle latitudes is not warranted the one other
formula in good agreement with that from the smithsonian tables is one derived by Lumb
Laevastu's formula is only acceptable at sun angles less than 50° and Berliand's estimates
are too high at all solar altitudes the formula from the smithsonian tables can be used to
compute insolation over the oceans with a random error of estimate probably not
exceeding 5% for periods of a few days or longer
