presents trends and techniques for successful intelligent decision making and transfer of products through digital signal processing

the book discusses receiving signals that most electrical engineers detect and study the vast majority of signals could never be detected due to random additive signals known as noise that distorts them or completely overshadows them such examples include an audio signal of the pilot communicating with the ground over the engine noise or a bioengineer listening for a fetus heartbeat over the mother's the text presents the methods for extracting the desired signals from the noise each new development includes examples and exercises that use matlab to provide the answer in graphic forms for the reader's comprehension and understanding

advanced methods in biomedical signal processing and analysis presents state of the art methods in biosignal processing including recurrence quantification analysis heart rate variability analysis of the rri time series signals joint time frequency analyses wavelet transforms and wavelet packet decomposition empirical mode decomposition modeling of biosignals gabor transform empirical mode decomposition the book also gives an understanding of feature extraction feature ranking and feature selection methods while also demonstrating how to apply artificial intelligence and machine learning to biosignal techniques gives advanced methods in signal processing includes machine and deep learning methods presents experimental case studies
