one central and enduring image of the social science researcher is of an individual who commits a great deal of time to collecting original primary data from a field of enquiry this approach is often underpinned by a sincerely held belief that key research questions can only be explored by the collection of ever new and ever greater amounts of data or that already existing data are insufficient for researchers to test their ideas yet such an approach to social science research can be problematic not least because the collection of primary data can be an expensive time consuming and even wasteful approach to social enquiry secondary analysis can serve many purposes as well as being a valid approach in its own right however despite its widespread application secondary analysis is often undervalued or perceived to be the preserve of only those interested in the re use of large scale survey data highlighting both the theory and practice of secondary analysis and the use of secondary sources this collection considers the nature of secondary analysis as a research tool reflects on the definitional debates surrounding terms such as secondary analysis data re use and restudies illustrates how secondary analysis is used in social science research and finally reviews the practical methodological and ethical aspects of secondary analysis volume one using secondary sources and secondary analysis volume two quantitative approaches to secondary analysis volume three qualitative data and research in

understanding the complexity of the natural world and making sense of phenomena is one of the main goals of science and science education when investigating complex phenomena such as climate change or pandemic outbreaks students are expected to engage in systems thinking by considering the boundaries of the investigated system identifying the relevant components and their interactions and exploring system attributes such as hierarchical organization dynamicity feedback loops and emergence

scientific models are tools that support students reasoning and understanding of complex systems and students are expected to develop their modeling competence and to engage in the modeling process by constructing testing revising and using models to explain and predict phenomena computational modeling tools for example provide students with the opportunity to explore big data run simulations and investigate complex systems therefore both systems thinking and modeling approaches are important for science education when investigating complex phenomena
