this volume presents the state of the art in several directions of research conducted by renowned mathematicians who participated in the research program on nonlinear partial differential equations at the centre for advanced study at the norwegian academy of science and letters oslo norway during the academic year 2008 09 the main theme of the volume is nonlinear partial differential equations that model a wide variety of wave phenomena topics discussed include systems of conservation laws compressible navier stokes equations navier stokes korteweg type systems in models for phase transitions nonlinear evolution equations degenerate mixed type equations in fluid mechanics and differential geometry nonlinear dispersive wave equations korteweg de vries camassa holm type etc and poisson interface problems and level set formulations

this volume contains the proceedings of the ams special session on spectral calculus and quasilinear partial differential equations and the ams special session on pde analysis on fluid flows which were held in january 2017 in atlanta georgia these two sessions shared the underlying theme of the analysis aspect of evolutionary pdes and mathematical physics the articles address the latest trends and perspectives in the area of nonlinear dispersive equations and fluid flows the topics mainly focus on using state of the art

methods and techniques to investigate problems of depth and richness arising in quantum mechanics general relativity and fluid dynamics

this memoir is devoted to the proof of a well posedness result for the gravity water waves equations in arbitrary dimension and in fluid domains with general bottoms when the initial velocity field is not necessarily lipschitz moreover for two dimensional waves the authors consider solutions such that the curvature of the initial free surface does not belong to L^2 the proof is entirely based on the eulerian formulation of the water waves equations using microlocal analysis to obtain sharp sobolev and hölder estimates the authors first prove tame estimates in sobolev spaces depending linearly on hölder norms and then use the dispersive properties of the water waves system namely strichartz estimates to control these hölder norms
