when José Garbe Vilijn awoke after a sudden brain bleed in 2005 a new life lay ahead of her true to her nature José saw this event as a huge opportunity never could she have imagined that it would gift to her a new paradigm in healing that would take her on an incredible journey of discovery not only has she treated 30 000 patients across the globe but alongside this her pidds solution has allowed her to regain her mobility and brain function she now runs a thriving practice in Dubai this revised edition of her book follows the stories of her original case studies first printed in 2008 proving the success of pidds over time it has been inspired by José's promise to reach as many people as possible across the globe to share her knowledge and passion for her logical solution to their health struggles and suffering in life this book offers inspirational stories clear advice and so much joy and celebration a truly uplifting book to read and revisit time and time again

bringing together leading experts and providing vital insights to guide clinical practice this is the first volume to comprehensively address childhood motor disorders from a neuropsychological perspective the book explores the neural and behavioral bases of movement disorders and summarizes current findings from applied research existing approaches to assessment and neuroimaging are critically examined and new and innovative methods presented authors also synthesize the latest knowledge on motor difficulties associated with specific developmental and neurological problems cerebral palsy neuromuscular disease autism brain injury disorders of coordination speech and written language and more other important topics covered include psychosocial effects of motor skills impairments frequently encountered comorbidities and the status of available intervention approaches

reading is at the interface between the vision and spoken language domains an emergent bulk of research indicates that learning to read strongly impacts on non linguistic visual object processing both at the behavioral level e.g. on mirror image processing enantiomorphy and at the brain level e.g. inducing top down effects as well as neural competition effects yet many questions regarding the exact nature locus and consequences of these

effects remain hitherto unanswered the current special topic aims at contributing to the understanding of how such a cultural activity as reading might modulate visual processing by providing a landmark forum in which researchers define the state of the art and future directions on this issue we thus welcome reviews of current work original research and opinion articles that focus on the impact of literacy on the cognitive and or brain visual processes in addition to studies directly focusing on this topic we will consider as highly relevant evidence on reading and visual processes in typical and atypical development including in adult people differing in schooling and literacy as well as in neuropsychological cases e g developmental dyslexia we also encourage researchers on nonhuman primate visual processing to consider the potential contribution of their studies to this special topic

in a survey of neuropsychologists published in the clinical neuropsychologist the first edition of the compendium was named as one of the eleven essential books in their field this second edition has been thoroughly updated to cover new developments in neuroscience cognitive psychology and psychological assessment it includes new chapters on test selection report writing and informing the client executive functions occupational interest and aptitude and the assessment of functional complaints in addition to updating research findings about the tests covered in the first edition the book now contains almost twice as many tests

the boston process approach to neuropsychological assessment advanced by edith kaplan has a long and well respected history in the field however its theoretical and empirical support has not previously been assembled in an easily accessible format this volume fills that void by compiling the historical empirical and practical teachings of the process approach the reader will find a detailed history of the precursors to this model of thought its development through its proponents such as harold goodglass nelson butters laird cermak and norman geschwind and its continuing legacy the second section provides a guide to applying the boston process approach to some of the field s most commonly used measures such as the various wechsler intelligence scales the trail making test the california verbal learning test and the boston naming test here the reader will find a detailed history of the empirical evidence for test administration and interpretation using boston process approach tenets the final section of the book provides various perspectives on the implementation of the boston process approach in various clinical and research settings and with specialized populations

integrating neuropsychological and psychological assessments is a resource for neuropsychologists psychologists teachers and parents who wish to address both the neurologically and emotionally based difficulties with which their children are presenting in addition to a thorough description of neuropsychological and psychological assessment tools this book also provides professionals with a unified approach to using the results from assessments to understand and integrate cognitive behavioral social and emotional functioning in school age children it posits that to educate and treat children who are struggling in school due to unique cognitive or emotional vulnerabilities the whole child must be considered to decipher their needs and implement interventions cultivating a therapeutic relationship that integrates the emotional and relational functioning of the child enhances both their learning and ability to successfully navigate the world

touch screen tablets have greatly expanded the technology accessible to preschoolers toddlers and even infants given that they do not require the fine motor skills required for using traditional computers many parents and educators wish to make evidence based decisions regarding young children s technology use yet technological advancements continue to occur faster than researchers can keep up with accordingly despite touch screen tablets entering society more than 5 years ago we are in the infancy of research concerning interactive media and children the topic has gained traction in the past couple of years for example theoretical papers have discussed how interactive media activities differ from physical toys and passive media christakis 2014 and how educational apps development should utilise the four pillars of learning hirsh pasek et al 2015 yet there has been little experimental research published on young children and touch screen use

the goal of the second edition is to introduce the advance undergraduate or graduate student and more seasoned research scientists in any of the allied health sciences to a wide array of methodological and biostatistical issues as they occur in the context of both published and ongoing research some sixty four articles published between 1992 and 2002 have been selected from the journal of clinical and experimental neuropsychology the clinical neuropsychologist and child neuropsychology and reproduced in this volume while building upon a working knowledge and understanding of the basic univariate data analytic techniques and the research designs to which they apply the approach to the more complex multivariate techniques is presented primarily at a conceptual and essentially non mathematical level while the issue of the complexity of some of the more recent and standard approaches to data analytic strategies and their important role to specific research designs is important to

convey there remains an even more fundamental issue of whether the results of correctly applied data analytic strategies make any practical or clinical sense above and beyond their having reached levels of statistical significance these critical issues are addressed throughout various commentaries that the editors make at appropriate points in the text the volume will appeal to advanced undergraduate and graduate students as well as clinical neuropsychologists and research scientists in any of the allied health disciplines

provides a comprehensive examination of testing and the assessment process for evaluation of children from ages 3 18 this book is based on the assumption that when a child is referred for assessment the goal is to solve the child s problem by developing appropriate academic or social interventions it emphasises on functional assessment

research on the human brain development has seen an upturn in the past years mostly due to novel neuroimaging tools that became available to study the anatomy and function of the developing brain magnetic resonance imaging mri and diffusion tensor imaging dti are beginning to be used more frequently in children to determine the gross anatomy and structural connectivity of their brain functional mri and near infrared spectroscopy nirs determine the hemodynamics and electroencephalography eeg the electrophysiological functions of the developing human brain magnetoencephalography meg complements eeg as the only other technique capable of directly measuring the developing brain electrophysiology although meg is still being used relatively rarely in pediatric studies the recent development in this technology is beginning to demonstrate its utility in both basic and clinical neurosciences meg seems to be quite attractive for pediatric use since it measures the human brain activity in an entirely passive manner without possessing any conceivable risk to the developing tissue meg sessions generally require minimal patient preparation and the recordings are extremely well tolerated from children biomagnetic techniques also offer an indirect way to assess the functional brain and heart activity of fetuses in humans in utero by measuring the magnetic field outside the maternal abdomen magnetic field produced by the electrical activity in the heart and brain of the fetus is not attenuated by the vernix a waxy film covering its entire skin a biomagnetic instrument specifically designed for fetal studies has been developed for this purpose fetal meg studies using such a system have shown that both spontaneous brain activity and evoked cortical activity can be measured from outside the abdomen of pregnant mothers fetal meg may become clinically very useful for implementation and evaluation of intervention programs in at risk populations biomagnetic instruments have also been

developed for specifically measuring the brain activity in newborns infants and older children meg studies have shown the usefulness of meg for localizing active regions in the brain and also for tracking the longitudinal maturation of various sensory systems studies of pediatric patients are beginning to show interesting functional pathology in autism spectrum disorder cerebral palsy epilepsy and other types of neurological and psychiatric disorders down syndrome traumatic brain injury tourette syndrome hearing deficits childhood migraine in this ebook we compile the state of the art meg and other neuroimaging studies focused on pediatric population in both health and disease we believe a review of the recent studies of human brain development using meg is quite timely since we are witnessing advances not only in the instrumentation optimized for the pediatric population but also in the research based on various types of meg systems designed for both human fetuses in utero and neonates and older children

deaf cognition examines the cognitive underpinnings of deaf individuals learning marschark and hauser have brought together scientists from different disciplines which rarely interact to share their ideas and create this book it contributes to the science of learning by describing and testing theories that might either over or underestimate the role that audition or vision plays in learning and memory and by shedding light on multiple pathways for learning international experts in cognitive psychology brain sciences cognitive development and deaf children offer a unique integrative examination of cognition and learning with discussions on their implications for deaf education each chapter focuses primarily on the intersection of research in cognitive psychology developmental psychology and deaf education the general theme of the book is that deaf and hearing individuals differ to some extent in early experience brain development cognitive functioning memory organization and problem solving identifying similarities and differences among these domains provides new insights into potential methods for enhancing achievement in this traditionally under performing population

neuropsychological testing can identify changes in cognition behavior and emotion aid in determining the cause of the change e.g. neurologic disease psychiatric disorders or developmental problems and assist clinicians in planning treatment and rehabilitation to use these tests properly professionals need an authoritative source of advice and guidance on how to administer score and interpret them written by two leading experts in neuropsychological assessment essentials of neuropsychological assessment is that source like all the volumes in the essentials of psychological assessment series this book is designed to help busy mental health professionals quickly acquire the knowledge and skills they need to make optimal use of major psychological assessment instruments each concise chapter features numerous callout boxes highlighting key concepts bulleted points and extensive illustrative material as well as test questions that help you gauge and reinforce your grasp of the information covered essentials of neuropsychological assessment provides comprehensive instruction on test administration scoring and interpretation the authors also address practical and conceptual issues related to neuropsychological assessment in geriatric pediatric forensic and other specialized settings as well as the essentials of report writing and common neuropsychological syndromes

in the foreword to volume 1 of this series byron rourke noted that the field of child neuropsychology is still young he wrote it has no obvious birthdate hence we cannot determine its age with the type of chrono metric precision for which our scientific hearts may yearn be that as it may activity in the field has been growing steadily if not by leaps and bounds although there is nowhere near the intensity of in vestigation of children from a neuropsychological standpoint as there is of adults there have been notable systematic investigations of considerable interest some of the more important of these are presented in the current volume i am happy to say that the contents of volume 2 likewise provide new insights across many important domains of developmental neuro psychology as the editors note this book consists of six chapters divided into four general areas including developmental neuropsychology one chapter abnormal neuropsychology three chapters assessment one chapter and treatment one chapter the first chapter is addressed to attention response inhibition and activity level in children in this chapter jeffrey m halperin kathleen e mckay kristin matier and vanshdeep sharma provide a lucid and articulate review of research on this topic the authors correctly note by that attention response inhibition and activity level are mediated neurocircuits throughout the brain that interact with and modulate vir tually all higher cognitive information processing domains

this updated and expanded edition retains a practical developmental and lifespan perspective for neuropsychological case formulation chapters cover the current status clinical issues and essential domains and techniques in clinical neuropsychological practice and research and include case vignettes that explicate brain behavior relationships in youth from preschool age through adolescence with medical disease or psychological disorder
