*listeria monocytogenes* is a foodborne pathogen that can cause a serious foodborne disease listeriosis which may result in abortion meningitis and septicemia the high hospitalization and mortality rates of listeriosis warrant continued research efforts to reduce the transmission of *l. monocytogenes* to humans molecular subtyping techniques which can be used to differentiate bacteria beyond the species level facilitate the identification and tracking of *l. monocytogenes* subtypes throughout the food chain pulsed field gel electrophoresis is a rapid and highly discriminatory molecular subtyping method currently used by public health and regulatory agencies to identify and track outbreaks of foodborne disease and link outbreak related cases to suspected vehicles although pfge facilitated outbreak recognition and response has been successful in reducing the number of listeriosis associated fatalities additional large scale analysis of subtype data is needed to develop a better understanding of *l. monocytogenes* ecology and further reduce the incidence of foodborne listeriosis to this end we subtyped 495 *l. monocytogenes* isolates from human clinical cases foods ruminant farms and urban and natural environments using two enzyme asci and apai pfge to better understand *l. monocytogenes* pfge type diversity and distribution we found that while *l. monocytogenes* is a genetically diverse organism nine pfge types were significantly associated with certain sources and two pfge types were specific to a single processing facility each conversely nine pfge types were geographically widespread and isolated from multiple sources indicating that large molecular subtyping databases are necessary to facilitate

epidemiological investigations by identifying the distribution patterns of pfge types that cause outbreaks to meet this need we developed pathogentracker a publicly available molecular subtyping database that will facilitate storage and large scale analysis of different *L. monocytogenes* subtype data data in pathogentracker can be queried through a variety of options including dna sequence and banding pattern based searches e g ribotype pfge type this database also allows for the creation of individualized summary tables and permits simple statistical analysis of summary table data currently populated with subtype data for over 6 000 *L. monocytogenes* isolates pathogentracker will facilitate more rapid listeriosis outbreak detection and source tracking development of a better understanding of *L. monocytogenes* transmission and ecology and definition of specific characteristics for *L. monocytogenes* subtypes isolated from different sources populations we also developed a freely available standard *L. monocytogenes* reference strain collection organized into a diversity set 25 isolates representing 25 pfge types and an outbreak set 21 isolates representing nine listeriosis outbreaks which has not been previously available in combination with inclusion of these isolates in pathogentracker which includes continuously updated information on strain characteristics and peer reviewed references that utilized specific isolates this strain collection provides a unique resource that will aid efforts to further improve our ability to reduce human foodborne listeriosis through development of improved diagnostic procedures and intervention strategies in addition this strain collection provides a unique resource for basic and applied studies on the physiology ecology evolution and pathogenesis of *L. monocytogenes* abstract
