masteringbiology is the most powerful online homework and assessment tool available. Tutorials follow the Socratic method, coaching students to the right answer by offering feedback specific to a student's misconceptions, as well as providing hints students can access if they get stuck. Masteringbiology helps instructors maximize class time with customizable, easy-to-assign and automatically graded assessments that motivate students to learn outside of class and arrive prepared for lecture. The powerful gradebook provides unique insight into student and class performance even before the first test, as a result, instructors can spend class time where students need it most. The mastering system empowers students to take charge of their learning through activities aimed at different learning styles and engages them in learning science through practice and step-by-step guidance at their convenience. 24/7

Rosenberg's *Molecular and Genetic Basis of Neurologic and Psychiatric Disease*, seventh edition, provides a comprehensive introduction and reference to the foundations and key practical aspects relevant to neurologic and psychiatric disease. This volume has been thoroughly revised and includes newly commissioned chapters on ethics, genetic counselling, and gene therapy for the central nervous system disorders. A favorite of over four generations of students, clinicians, and scholars, this new edition retains and expands the informative, concise, and critical tone of the previous edition. This is an essential reference for general medical practitioners, neurologists, psychiatrists, geneticists, and related professionals, and for the neuroscience and neurology research community at large. Both volumes combined provide a comprehensive coverage on the neurogenetic foundation of neurologic and psychiatric disease. This volume provides a detailed introduction on both the clinical and basic research implications of molecular and genetics surrounding the brain. Includes new chapters on genomics of human neurological disorders, CRISPR, and genome engineering.

This book addresses the issue of improving the accuracy in exon prediction in DNA sequences using various adaptive techniques based on different performance measures that are crucial in disease diagnosis and therapy. First, the authors present an overview of genomics engineering, structure of DNA sequence and its building blocks, genetic information flow in a cell, gene prediction along with its significance and various types of gene prediction methods, followed by a review of literature starting with the biological background of genomic sequence analysis. Next, they cover various theoretical considerations of adaptive filtering techniques used for DNA analysis with an introduction to adaptive filtering, properties of adaptive algorithms, and the need for development of adaptive exon predictors (AEPs) and structure of AEP used for DNA analysis. Then, they extend the approach of least mean squares (LMS) algorithm and its sign-based realizations with normalization factor for DNA analysis. They also present the normalized logarithmic-based realizations of least mean logarithmic squares (LMLS) and
