Several chapters review environmental biochemistry and toxicology, and the final chapters describe analytical methods for measuring chemical and biological waste. New features in this edition include enhanced coverage of chemical fate and transport, industrial ecology, particularly how it is integrated with green chemistry, conservation principles and recent accomplishments in sustainable chemical science and technology. A new chapter addressing terrorism and threats to the environment and the use of real-world examples.

The impact of human activity has increasingly become a significant factor as well. This is especially true concerning significant climate changes commonly known as global warming. The factors affecting climate, the various climate classification systems and international responses to global warming are all carefully considered in this volume.

The Arctic can be viewed as an integrated system characterised by intimate couplings between its atmosphere, ocean and land, linked in turn to the larger global system. This comprehensive up-to-date assessment begins with an outline of early Arctic exploration and the growth of modern research using an integrated systems approach. Subsequent chapters examine the atmospheric heat budget and circulation, the surface energy budget, the hydrologic cycle and interactions between the ocean, atmosphere and sea ice cover. Reviews of recent directions in numerical modelling and the characteristics of past Arctic climates set the stage for detailed discussion of recent climate variability and trends and projected future states. Throughout, satellite remote sensing data and results from recent major field programs are used to illustrate key processes. The Arctic climate system provides a comprehensive and accessible overview of the subject for researchers and advanced students in a wide range of disciplines.
