soil formation deals with qualitative and quantitative aspects of soil formation or pedogenesis and the underlying chemical biological and physical processes the starting point of the text is the process and not soil classification effects of weathering and new formation of minerals mobilisation transport and breakdown or immobilisation of dissolved and suspended compounds are discussed soil processes and profiles are discussed in relation to the landscape the geosphere and the biosphere emphasis lies on the universality of soil forming processes in past and present and on the soil as a dynamic entity that forms part of the total environment complexity of genetic

processes in time and space is given much attention the text gives many examples from literature and places some in a new light the reader is guided through the subject matter by a large number of questions and problems to help understand and synthesis the material answers to all questions are included this second edition has been updated to reflect recent discoveries printing errors have been corrected and new photographs support the text

quantitative assessments of the effects of global change on soil development are mostly focused on soil carbon some nutrients pollutants and soil water soil however is

a complex entity with interacting biological physical and chemical processes that are rarely modelled in its entirety additionally for the sake of simplicity various soil properties are considered constants whereas in reality they are not soil as we observe it is the resultant of many processes driven by varying boundary conditions such as climate and organisms including men this is not different when we study global change thus modelling soil development under global change overlaps with modelling soil formation this book gives an overview of what such model should entail with ample descriptions to use soilgen a simulation model to study pedogenesis
