this paper describes south africa's economic development and challenges south africa has made considerable economic and social progress over the past two decades but faces substantial challenges global transitions china's slowdown and rebalancing weak commodity prices and u.s. monetary policy normalization are taking a heavy toll on south africa growth and employment which were already low are faltering and continue to underperform peer countries vulnerabilities remain elevated and have increased in the real and fiscal sectors boosting growth and job creation thus reducing extremely high unemployment and inequality and promoting social transformation remain south africa's key challenges

distribution theory a relatively recent mathematical approach to classical fourier analysis not only opened up new areas of research but also helped promote the development of such mathematical disciplines as ordinary and partial differential equations operational calculus transformation theory and functional analysis this text was one of the first to give a clear explanation of distribution theory it combines the

theory effectively with extensive practical applications to science and engineering problems based on a graduate course given at the state university of new york at stony brook this book has two objectives to provide a comparatively elementary introduction to distribution theory and to describe the generalized fourier and laplace transformations and their applications to integrodifferential equations difference equations and passive systems after an introductory chapter defining distributions and the operations that apply to them chapter 2 considers the calculus of distributions especially limits differentiation integrations and the interchange of limiting processes some deeper properties of distributions such as their local character as derivatives of continuous functions are given in chapter 3 chapter 4 introduces the distributions of slow growth which arise naturally in the generalization of the fourier transformation chapters 5 and 6 cover the convolution process and its use in representing differential and difference equations the distributional fourier and laplace transformations are developed in chapters 7 and 8 and the latter transformation is applied in chapter 9 to obtain an operational calculus for the solution of differential and difference equations of the initial condition type some of the previous theory is applied in chapter 10 to a discussion of the fundamental properties of certain physical systems while chapter 11 ends the book with a consideration of periodic distributions suitable for a graduate course for engineering and science students or for a senior level undergraduate course for mathematics majors this book presumes a knowledge of advanced calculus and the standard theorems on the interchange of limit processes a broad spectrum of problems has been included to satisfy the diverse needs of various types of students
