this textbook presents the most efficient analytical techniques in the local bifurcation theory of vector fields it is centered on the theory of normal forms and its applications including interaction with symmetries the first part of the book reviews the center manifold reduction and introduces normal forms with complete proofs basic bifurcations are studied together with bifurcations in the presence of symmetries special attention is given to examples with reversible vector fields including the physical example given by the water waves in this second edition many problems with detailed solutions are added at the end of the first part some systems being in infinite dimensions the second part deals with the couette taylor hydrodynamical stability problem between concentric rotating cylinders the spatial structure of various steady or unsteady solutions results directly from the analysis of the reduced system on a center manifold in this part we also study bifurcations simple

here from group orbits of solutions in an elementary way avoiding heavy algebra the third part analyzes bifurcations from time periodic solutions of autonomous vector fields a normal form theory is developed covering all cases and emphasizing a partial floquet reduction theory which is applicable in infinite dimensions studies of period doubling as well as arnold's resonance tongues are included in this part

this book is an outgrowth of classes given at the university of california santa barbara mainly for students who had little mathematical background many of the students indicated they never understood what mathematics was all about beyond what they learned in algebra and geometry was there any more mathematics to be discovered or created how could one actually discover or create new mathematics in order to give these students some sort of answers to such questions we designed a course in which the students could actually participate in the discovery of mathematics
