published by the american geophysical union as part of the geophysical monograph series volume 47 there are a number of reasons for organizing a symposium one is to bring specialists together to discuss a specific problem in which they all have expertise and encourage the participants to talk openly about their current work which in all likelihood is not going to be in publishable form for some time another reason might be that a problem has been identified by one group of experts which needs the input from a previously loosely allied group before real progress can be made the international union of geodesy and geophysics symposium u s hydrogeological regimes and their subsurface thermal effects organised for the august 1987 general assembly in vancouver was a symposium of the latter type

doctoral thesis dissertation from the year 2022 in the subject mathematics applied mathematics grade 75 0 ladoke akintola university of technology course applied mathematics language english abstract this thesis aimed at studying the reacting system of boundary layer flow of cuo oil based nanofluid with heat generation through a vertical permeable surface a boundary layer is formed whenever there is a relative motion between the boundary and the fluid the details of flow within the boundary layer are very important for the understanding of many problems in aerodynamics including the wind stall the skin drag on an object heat transfers that occur in high speed flight and in naval architecture for the designs of ships and submarines the concept of boundary layer was first introduced by prandtl in 1904 and since then it has been applied to several fluid flow problems the science of fluid dynamics encompasses the movement of gases and liquids interaction of fluid with solid and the study of forces related to these phenomena it plays an important role in every aspect of our daily life for example from morning bath to evening coffee it has potential applications in the field of science engineering manufacturing transportation environment medicine energy and others flows are important for the existence of natural and technical world properties of the fluid forces acting on the fluid particles and boundaries of the flow domain determine the resultant flow pattern deformation of fluids occurs continuously under application of shear stress which makes them isotropic substances navier stokes equations are the fundamental equations of the fluid that portray the stream as either newtonian or non newtonian harlow and amsden there is a broad scope of heat transfer applications in numerous industrial processes involving mechanical electrical and chemical industry achieving higher convective rate of heat transfer in thermal systems and processes has always been the challenges facing scientists and engineers as a result this process requires an immensity amount of vitality to manage the method of fluid heating cooling and transport of heat it is known that cooling is necessary for maintaining the preferred performance and steadfastness of an engine heat transfer fluids like water oil ethyl glycol and salt water collect and transport heat from the region with high temperature to the region with low temperature in automobiles piston converts the heat generated as a result of the combustion of the fuel into mechanical work and drives the crankshaft in the course of the connecting rod continuous heating of the piston without proficient cooling can lead to elevated fuel and oil utilization harmful exhaust emissions reduction in engine power output or undeviating engine damage heat transfer fluids are

expected to have high thermal conductivity high volumetric heat capacity and low viscosity on the other hand the heat carrier fluids have low thermal conductivity and affect the proper functioning of the system in order to guarantee durability reliability and extend lifespan of an engine there is need for use of heat carriers fluid with improved heat transfer properties the innovative conception of nanofluid was proposed as a solution to these challenges nanofluid an improved heat transfer fluid is a fluid dispersed which contains nanoparticles of size range 1 100nm the fluids such as oil water and ethyl glycol are some of the fluids used in nanofluid materials commonly used as nanoparticles are chemically stable metals copper gold metal oxides  $\text{CuO}$   $\text{Al}_2\text{O}_3$  and carbon in various forms diamond graphite carbon nanotubes the mixture of concentration of nanoparticles into the heat carrier fluids enhances the viscosity of nanofluids and other thermo physical properties like thermal conductivity specific heat capacity and density oil based nanofluids is used in the cooling of electronic equipment nuclear reactors power transformers and automobile engines oil in an engine cushions the bearings in opposition to the shocks of firing cylinders it serves as lubricant to neutralize the corrosive elements during combustions and prevents the metal surfaces of an engine from rust it also serves as coolant agent for parts of engine that are not exposed to the water cooling system metal oxides are commonly used as thermal additives in nanofluid due to their outstanding properties such as high thermal conductivity and excellent compatibility with base fluid  $\text{Al}_2\text{O}_3$   $\text{TiO}_2$   $\text{ZnO}$  and  $\text{CuO}$  are the most popular metal oxides nanoparticles nanofluids containing metal oxides have exhibited special potentials in heat transfer applications among various metal oxides nanoparticles  $\text{CuO}$  has higher thermal conductivity it is a monoclinic crystal structure and has many attractive properties  $\text{CuO}$  particles have spheroid shapes and most of the particles are under aggregate states and to have an efficient nanofluid the particles should have spherical shape to have a higher critical dilute limit excessive concentration of nanoparticles in base fluid at low temperature leads to increase in the density of nanofluid which is the compactness of nanoparticles it results into very thick nanofluid and this leads to viscous nano oil which provides stronger fluid film and the thicker the nanofluid film the more resistant it will be rubbed from lubricated surfaces nanofluids viscosity is the measure of its thickness or struggle to flow it is directly connected with how well oil based nanofluid lubricates and protects surfaces that it moves through however very thick nanofluid offers excessive resistance to flow at low temperatures and as a result may

not flow quickly enough to those parts requiring lubrication it is therefore crucial that for nanofluid to be effective it must exhibit moderate concentration of nanoparticles and the right thermo physical properties at both the highest and the lowest temperatures which are necessity for proper functional of the engine
