a classic in its field air conditioning principles and systems continues to fill the need for a text book on air conditioning systems that combines design principles with real world applications readers will gain insight into the design operation and troubleshooting of new and existing air conditioning systems moreover this edition has been updated to reflect recent developments and issues in the industry including the increasing use of the internet in the field key features of this edition new weather data for outside temperature analysis and system design expanded information on environmental problems to help readers stay current on issues and regulations new information about asbestos including answers about mitigation of harmful effects further exploration on scroll compression and how it works in real world applications

this text provides a guide to the specification and application of all types of commercial and residential air conditioning equipment it guides the reader through each step of the process of proper system design including equipment selection sizing placement and installation

the air conditioning manual assists entry level engineers in the design of air conditioning systems it is also usable in conjunction with fundamental hvac r resource material as a senior or graduate level text for a university course in hvac system design the manual was written to fill the void between theory and practice to bridge the gap between real world design practices and the theoretical calculations and analytical procedures or on the design of components this second edition represents an update and revision of the manual it now features the use of si units throughout updated references and the editing of many illustrations helps engineers quickly come up with a design solution to a required air conditioning system includes issues from comfort to cooling load calculations new sections on green hvac systems deal with hot topic of sustainable buildings

this book was created to direct readers the right way of installing different types of air conditioning units cooling equipment is necessary equipment needed by humans with the ever warming temperature and increasing humidity of the environment installing air conditioning units at home and at work area is vital to productivity the history of air cooling systems is mentioned in the first chapter where it was mentioned that it originated from the ancient egypt ancient romans followed what the egyptians started while the persians continued then trend it was not until an american engineer developed the model of the modern units we use today chapter two of how to install air conditioning in house defines what air conditioning is all about it tells the difference of personal comfort and industrial applications industrial air conditioning usually requires better precision about temperature humidity and moisture control some applications also demand a high degree of filtering and removal of contaminants in chapter three it talks about how an air conditioning unit works while most of us consider air conditioning as associated with cold it is basically a concept of transfer of heat more technically known as heat convection an indoor unit absorbs more heat thus cool air is what is left behind in the succeeding chapters the different types of air conditioning systems are thoroughly specified as well as their advantages and disadvantages in using them there are health concerns that must be looked upon because many families are unaware about these health issues that might affect every user chapter eight would tell the reader that an air conditioning system is installed inside a particular room most especially when running a business ac system is one important thing to invest for it must be included in the list of expenses because working areas when humid affect the productivity of your personnel how to install air conditioning in house also specifies the three key parts of an air conditioning unit namely the compressor the condenser and the evaporator every unit s compressor and condenser are seen as the outer part of the unit while the evaporator is the one located in the room when these three major parts work they create the processes of enthalpy fluid pressure and the dissipation of heat as the process happens heat is always extracted and removed this particular heat is responsible in the separation and distinction of liquid from gas the author is totally in high spirits in creating this book as guide to installing a cooling system the book also includes the advantages or benefits one can get once an air conditioning unit is installed it also illustrates the reasons why installing a cooling system is very important

this expanded edition of david chadderton s air conditioning is a textbook for undergraduate courses in building services and environmental engineering and for btec continuing education diploma higher national diploma and certificate courses in building

services engineering it will also be of considerable help to students on national certificate and diploma programmes the book includes a new chapter on application of fans to airduct systems

air conditioning system has been introduced in past several decades in order to serve comfort condition to the humans air conditioner is defined as control air movement temperature humidity and cleanliness in a needed space meanwhile chilled water is to control the movement of water air fluid flow and temperature from chiller plant room there are several types of system where hot air can be removed from a system in the process of refrigeration and air conditioning basic air conditioning systems and chilled water covers four main components including compressor condenser throttling valve and evaporator the process of heat removal can be done by heat transfer directly or indirectly since the system been introduced performance of the system will be the main issues and until now there are many researches still ongoing in order to get the best performance of air conditioning system faculty of mechanical engineering fkm in pekan has started its operation in july 2009 and almost building in the faculty is occupied with air conditioning system the type of air conditioning system in the faculty is central unit air conditioning system the performance of the air conditioning system in the faculty becomes an interesting part to be studied to those who are in that field an informal interview was conducted with officials from the jabatan pembangunan dan pengurusan harta jpph that is responsible for monitoring this air conditioning system the problem that arises in the central air conditioning system in the fkm are influences jpph to cooperate in order to help an individual for analyzing the performance of air conditioning system the objective of this project is to review the working system and analyze the performance of air conditioners and chilled water system for daily use in addition evaluation and review of cooling load is also taken into account for two rooms specifically name by computer lab and excellent centre the heat gain analysis is compulsory conducted in order to estimate performance of central unit air conditioning system the heat gain for the computer lab and excellent centre is calculated to be 23 297kw and 39 952kw respectively different condition of date were taken and been analyzed which is performances of the system using single chiller running alternately and two chiller running simultaneously the result shows that when the system is being operated with single chiller simultaneously the total available cooling capacity can be ranging between 770kw to 810kw whereas for two chiller operations the total available cooling capacity by the chiller is 1246 77kw the room total load capacity with single chiller in operation alternately the value load capacity for computer lab is ranging from 18 072kw to 20 482kw and for excellent centre is 26 746kw to 27 981kw while for two

chiller operations simultaneously the room total load capacity for computer lab is 25 301kw and for excellent centre is 42 168kw it can be conclude that air conditioning system running with single chiller operation is not enough to absorb the heat gain in the particular room in the present of study therefore the system with 2 chiller operation is the best to meet the needs and more systematic guide for the consumer at faculty of mechanical engineering fkm in pekan study also emphasizes the relationship between temperature pressure flow rate the amount of cooling and performance of work for each component and total components involved
